era, and, as the output was in excess of domestic demand, the surplus was exported to Holland. In 1871 the property was in private hands and when it came into the possession of the late Ichibei Furukawa, in 1867, was in such poor condition that its yield was only about 50 tons of copper yearly, but, by prudent management and thorough development, coupled with the introduction of modern methods and machinery, was made the foremost copper mine of Japan. Forces averaged over 7,000 men in 1911, with 3,000 men underground.

The Ashio mine comprises a tract of 1,500 acres, with 3 mines, known as the Honzan, Kotaki and Tsudo, lying within a distance of 3 miles. The mountain which contains the mine is a volcanic plug or neck of liparite, upthrust through Paleozoic rocks and carries more than 300 different veins, in several different groups, with different strikes and mainly sharp dips, averaging about 75° with the horizon. There are 2 series of fissures that intersect, forming rhombic nets of veins, which are narrow, carrying chalcocopyrite, sphalerite and galena, associated with arsenopyrite and pyrrhotite, with mainly quartz gangue. About 70 different veins are more or less developed and are reported by the company as averaging about 3' in width, and 1,200' in length, some having been proven to depth of 2,000'. Principal veins are the Yokomuhu, 6,000' long, and the Kosei, 3,000' long. The oxidized zone shows occasional native copper, cuprite, azurite and malachite, and the secondary zone carries bornite and chalcocite, with quartz gangue and occasional alumina, principal ore values being in the sulphides. The management estimates the ore to average about 3% copper, with small quantities of silver and gold. Rich ore is sorted underground and brought up to about 12% in copper tenor, while second-grade ore is said to average only about 1% copper.

Working is carried on by 3 long tunnels and the 3 mines are connected underground. The Honzan and Kotaki tunnels connect; the Tsudo tunnel is 450' lower than these; below the Tsudo are 8 levels 110' vertically apart. Workings extend for over 1,100' above the Honzan tunnel level, giving a total depth to the mine of 2,500'. Each mine is connected, by ground tram, with its own dressing plant. The Honzan mine has the 6,000' Honkuchi drift tunnel, and 4 shafts, No. 1, 450'; No. 2, 740'; No. 3, 910'; No. 4, 280'. The Kotaki mine has the 7,000' Ariki drift tunnel, the 6,000' Kotaki drift tunnel and the 600' Sunoko-Bashi shaft. The Tsudo mine has a 1,000' crosscut tunnel, 11' high and 13' wide, with 3 shafts.

The Ashio mines as a whole have about 100 miles of workings and produce daily about 800 long tons of ore, broken mainly by overhand stopping, generally with hand drilling, but with some use of water Leyner and Little Wonder power drills for drifting and sinking. The mines are solidly timbered and the principal workings are electric lighted. There are 14 pumps aggregating about 600 h. p. The system of natural ventilation is aided by regulating doors and occasional brattices, with centrifugal fans for the lower workings. The mine has electric hoists, and electric haulage plants in the Ariki, Kotaki and Tsudo tunnels.

The ores of the mine are separated by hand picking into first-class 12% ore, bagged for shipment to the smelter, and second-class ore, averaging 1% copper, sent to concentrating mills. Hand picking is by women, whose wages are about $12\frac{1}{2}$ cts. per day.

Machinery equipment at the mine is modern throughout, with mainly American and German machinery. Each of the 10 shafts has a hoist, 9 having electric double-drum hoists, of 35 to 100 h. p., good for depths of 540 to 1,000'. There are 7 air compressors of 2 to 7 drill capacity, with aggregate capacity of 22 drills.

Equipment of the different mills includes 12 grizzlies, 18 picking tables, 78 trommels, 5 Blake crushers, 1 Dodge crusher, 5 stamps, 6 sets of rolls, 2 sets of Sturtevant centrifugal rolls, 111 Hartz jigs, 24 hydraulic classifiers, 16 settling tanks, 5 Wilfley sand tables, 11 Overstrom tables, 9 Evans slime tables, 2 Wilfley slime tables, and 7 conveying belts. The bulk of the ore is concentrated to about 15% copper tenor. The newest plant, erected in 1912, is at the portal of the Tsudo tunnel; it differs only in detail from the other mills, but has double cone classifiers and Callow screens. A peculiarity of the plant is the succession of settling dams in which the waste water from the mills is neutralized by lime and sand filtered; the copper recovered pays the cost and the water is fit for agriculture. In connection with the mills are small leaching plants, yielding a daily average of 2,400 kgs. of 58% cement copper.

The Ashio smelter, of 300 tons daily capacity, completed 1904, has three 100-ton 42x160" water-jacket blast furnaces, with 3 No. 8 Connorsville blowers. The average product smelted contains 12% copper, 28% iron, 25% sulphur and 32% silica. Lump ores are charged raw and fines are sintered. The sintering plant has pot-roasters of conical shape, made of iron plates, with false bottoms, taking 7-ton charges, which are cooled and crushed after sintering. The plant has 12 pots, in 2 rows, used alternately. Furnace product is a 37% matte, with slags averaging 0.2% copper. The smelter has a special dust chamber for the condensation of fumes which, after the precipitation of dust, enter a common flue and go to the bottom of a desulphurizing tower where sulphurous acid gas is absorbed by sprays of limewater. Smelter fuel is coke, costing an average of 24 yen per metric ton, with a yearly consumption of 4,150 tons.

The converter department has a 40-ton electric traveling crane, 2 stands with hydraulic tilting gears and six 72x100" shells, of barrel type, with 11 tuyeres each. The converter plant has 2 horizontal blowing engines, electrically driven, and 1 vertical engine, driven by water power, furnishing air at 10 lbs. pressure. A peculiarity of smelting practice is the feeding of coal through the tuyeres of the blast furnace when needed to promote smooth running. There is a silica mill, using decomposed liparite for linings. The converters cast 70-lb. ingots, averaging 99.108% copper, 0.15% silver and 0.00045% gold. The converter copper is refined at Nikko, in the company's own refinery.

The briquetting plant has 2 processes for briquetting fine ore, patented in Japan and the United States, 1 providing for the making of balls of fines, surrounded in the moulds by molten matte, the second process providing for a mixture of dried fines and molten matte in the pots. Cost 30 cts. per ton.

Smelter fumes are practically eliminated by four 40' steps in the big inclined flue lying on the steep mountain side, in which a solution of lime-water from an iron plate with 200 c.m. holes rains down on the gases and eliminates sulphurous acid.

The Ashio uses electric power throughout, employing 2,500 kw. at the mine, 370 kw. at the mills and 450 kw. at the smelter. The Hosoo hydro-electric plant is 12 miles from the mines, developing 7,500 h. p. In addition to the Hosoo plant, there are 11 other smaller water-power plants, up to 900 h. p. in size, with a total capacity of 2,550 h. p. Electric current from the hydro-electric plants is transmitted, at high voltage, to 3 stations, and there stepped down for use at the mine, mills and smelter. The government returns credit the Ashio with power installations aggregating 18,884 h. p.

The Ashio is 11 miles west of Nikko, the nearest station on the Imperial

Government railway, a very rugged country intervening. Transport between Nikko and Ashio, which was formerly by bullock wagons and aerial trams, was replaced in 1910 by an electric trolley line, built by the Ashio Tramway Co., connecting the mines with Kiryu station on the government railway line. The aerial tram system includes 2 lines, each of about 19,500' length, having some very long and high spans, crossing the crest of the mountains between Nikko and Ashio. There also are subsidiary aerial trams, including lines of Bleichert, Hallidie and Tamamura manufacture, with a total capacity of about 1,300,000 ton-miles yearly. The Ashio Tramway Co., controlled by the Furukawa Mining Co., has 25 miles of electric railway.

Cost of the Ashio copper is probably a trifle above 9 cts. per lb., finished. Production has increased but slightly during the past 10 years, having been 13,402,730 lbs. in 1900; 14,830,192 lbs. in 1906; 14,023,246 lbs. in 1907; 15,467,578 lbs. copper and 82,903 oz. silver in 1908; 15,631,326 lbs. in 1910; 16,758,200 lbs. in 1911 and 20,921,987 lbs. copper in 1912.

The Ani mines are at Kita-Akita-gori, Akita-ken, Ugo, on the western slope of the Moriyoshi mountains. Shigeo Kasai, mine mgr. The Ani is a group of 5 old mines, known as the Kosawa, Kayakusa, Magi, Sammai and Ichinomata. These mines have an area of upwards of 3,000 acres, in a distance of about 5 miles, and were modernized about the beginning of the twentieth century. The group shows Tertiary sedimentaries, liparite and andesite, the Tertiary rocks being chiefly altered tuffs and tuffaceous shale, with 2 series of veins traversing the entire formation, one with east-west strike, and the other with north-south strike, cutting each other, the former with numerous veins, not wide nor long, the latter with few but strong veins. The oxidized zone is deep, carrying native copper, malachite and chrysocolla, succeeded by a secondary zone carrying some bornite and chalcocite, the primary zone carrying chalcopyrite with occasional galena and sphalerite, associated with pyrite, with gangue mainly quartz, and occasional quartzite and barite. Both copper and lead ores are argentiferous, considerable silver being secured as a byproduct. In 1907 the Ani group employed an average of 3,108 persons. The Kosawa mine was discovered A. D. 1670, the others a little later, and the group was purchased by Ichibei Furukawa in 1885. The Kosawa mine has 2 tunnels and a blind shaft, and the Kayakusa mine also has 2 tunnels and a blind shaft. The Magi mine has 2 tunnels and the Sammai mine 3 tunnels. The Ichinomata mine has a 6,600' tunnel, which is the main transportation and drainage tunnel for the entire Ani group.

The Ani has 10 small dressing plants, producing 10% concentrates, with aggregate capacity of only 54 tons of ore daily.

The Ani smelter, known as the Shinonome works, at Yamamoto-gori, Akitaken, Ugo, of 75 tons daily capacity, has stall furnaces for roasting, the process requiring 3 weeks. There is a 45-ton 36x100" oval blast furnace, and a 30-ton 36x65" rectangular water-jacket blast furnace, with 2 No. 6 Connorsville blowers, supplying air to the blast furnaces and Mabuki hearths. First-fusion product is a 40% matte, which is tapped into matte pots and charged into 7 Mabuki hearths, each taking 7,000-lb. matte charges, requiring 24 hours for reduction, and turning out blister copper averaging 98% copper and 0.11% silver, sent to the Nikko works for electrolytic refining. This plant also produces 225,000 lbs. of pig lead yearly.

Power is furnished by a 1,000-h. p. hydro-electric plant built, 1910, at Hitachinai. There is a light railway connecting the mine and works on the Ani river, with the station of Futatsui on the Imperial railway.

Production of the Ani was 2,498,646 lbs. fine copper and 44,610 oz. silver in 1907; 2,849,687 lbs. copper and 49,630 oz. silver in 1908; 3,681,424

lbs. copper and 50,000 oz. silver in 1910; 2,659,774 lbs. copper in 1911 and 2,579,580 lbs. copper in 1912.

The Kusakura mine is at Higashikambara-gori, Niigata-ken, Echigo. S. Gamoh, mgr. Lands are about 600 acres. The mine was discovered A. D. 1739, and bought, 1876, by Ichiberi Furukawa, being his first venture in copper mining. The Kusakura has Tertiary sandstone, shale and tuff, with liparite and andesite dikes and sheets, carrying 4 nearly parallel main veins, which are richest in the sandstone and leanest in shale and tuff. There are 3 veins, longest 2,500', of 2" to 6' width, with an average of 12", having numerous branches. The upper workings show native copper and cuprite, succeeded by bornite and chalcocite in the secondary zone, followed by chalcopyrite, associated with pyrite and but rarely with galena and sphalerite, with scanty quartz gangue, ores carrying no appreciable gold or silver values. The mine is developed by 4 tunnels, and employed, 1908, an average of 489 hands.

The Kusakura has small steam and hydro-electric plants, aggregating 253 h. p. Transportation is by a railroad. There is a small mill, with hand-dressing, giving a daily product of 7 tons of 12.5% selected ore. The 40-ton smelter has two 20-ton 30x60" blast furnaces, making 40% matte, and 3 Mabuki hearths, using heavy petroleum, this being the first smelter in Japan to use liquid fuel for metallurgical work. Production has shown a decline during the past decade, being 373,118 lbs. in 1911 and 180,515 lbs. in 1912.

The Furokura group is at Kazuno, Rikuchu. Lands are about 2,200 acres, including the Furokura and Hosoji mines. The Furokura was discovered A. D. 1681, and purchased 1887 by I. Furukawa, and the Hosoji was opened in 1904. The Furokura was idle, 1794 to 1868, when reopened. Property is 22 miles from the nearest railway, with a good wagon road connecting. Forces average 700 hands. There is a 275-h. p. power installation. Lands show Tertiary tuffs, shale and andesite, traversed by numerous fissure veins, carrying chalcopyrite associated with pyrite, and rarely with sphalerite and galena, with quartz gangue and clay gouge. The Furokura mine is opened by 2 tunnels and 2 incline shafts and the Hosoji mine has 5 levels, 70 to 80' apart, connected by winzes.

The Furokura works, on the opposite side of the mountain from the mines, include a mill and smelter. High-grade ores are screened and hand-picked, low-grade ores being washed and concentrated, with an average daily production of 48 tons of 8% concentrates. The smelter has two 30-ton 30x60" water-jacket blast furnaces, yielding 45% matte with 0.4% slags. Fines are briquetted, then roasted with lump ores in open stalls and roasted ores are smelted in the blast furnaces. Production of the Furokura was 746,605 lbs. fine copper in 1906; 1,021,314 lbs. in 1907, and 1,283,253 lbs. in 1908, gradually increasing in recent years to 4,003,924 lbs. in 1911 and 3,451,850 lbs. in 1912.

The Mizusawa mine, at Waka-gori, Iwate-ken, Rikuchu, area about 1,000 acres, was discovered A. D. 1717, opened 1737, and purchased 1891 by I. Furukawa. The property has two 3' veins at the junction of granite and liparite, carrying mainly chalcopyrite, with occasional galena and sphalerite, associated with pyrite, with scanty quartz gangue. The ores carry no appreciable gold or silver values. The mine is opened by 2 tunnels, the 1,400' main transportation tunnel being on the 6th level. The mine and works have a 282-h. p. plant and employ an average of 700 persons.

The Mizusawa reduction plant includes a small mill, turning out 10% silicious concentrates, and a small smelter having a 25-ton 23x66" rec-

tangular water-jacket blast furnace, making 40% matte, which is refined in Mabuki hearths. Production has increased from 477,415 lbs. fine copper in 1906 to 820,470 lbs. copper in 1911 and 744,228 lbs. in 1912.

The Nagamatsu mine, at Nishimurayama, Uzen, 1,000 acres, was discovered during the latter half of the seventeenth century. The property shows Tertiary tuff and shale, traversed by andesite dikes, carrying numerous veins, mainly parallel, with nearly north-south strike, and steep dip to the east. The Okubi, which is the main vein, has an average width of 6 to 12" only, with maximum of 24", carrying mainly chalcopyrite and occasional sphalerite and galena, associated with pyrite, in a scanty quartz gangue, with occasional barite. Development is by 2 tunnels, longest 5,000'. The mine has only a 20-h. p. power plant and employs an average of 700 men.

The Nagamatsu reduction plant includes a very small mill, yielding 7 tons of 12.4% copper concentrates daily, and a small old smelter. Ore is roasted in open stalls, smelted to matte in Japanese hearths, and blown to blister copper with blast from a No. 4 Connorsville blower, in the same hearth. The hearths take 5,000-lb. charges of roasted ores, requiring 1,500 lbs. of charcoal for each charge, with 10 hours for smelting, yielding 35% matte, which is roasted in stalls and resmelted to 60% matte, which is again roasted and smelted to blister copper of 97% average tenor in Mabuki hearths. Production but 610,590 lbs. fine copper and 12,203 oz. silver in 1907, increased to 908,926 lbs. copper in 1911 and 1,237,009 lbs. in 1912.

The Kune mine, at Sakuma-mura, Iwate-gori, Shizuoka-ken, Totomi, with an area of upwards of 3,000 acres, was opened A. D. 1731, and was mainly idle until 1897, when taken over by I. Furukawa. The property shows graphitic and chloritic schists, probably of the Algonkian series, with 3 horizons of ore beds, faulted by 2 synclinal step faults and one diagonal fault. The upper or Okuhi bed is the strongest, being 45 to 100' wide, 1,500' long and opened to depth of about 1,000'. The middle bed is about 12' wide and the lowest bed, of about 6' average width, splits into 2 seams at the bottom. Ore is mainly chalcopyrite, associated with pyrite, with compact granular texture and occasional magnetite, with rather scanty quartz gangue. Richer portions of the veins range 6 to 7% in copper tenor, with a range of 3 to 8% for the entire mine. The mine has 1 shaft and 2 tunnels, a 2,000' tunnel having double tracks, with 9 levels opened. Ore is mined by overhand stoping and the mine is timbered with square sets. The Kune has no power plant and no reduction works, shipping selected ore for smelting, but has a small leaching plant yielding about 60 tons of 50% precipitate yearly. An aerial tram leads from the spalling house to bins on the river Tenryu, where ore is loaded on boats and carried to the government railway. Production was 1,250,000 lbs. in 1907, and 1,300,000 lbs. fine copper in 1908. Recent production not separately reported.

The Otori mine, at the village of Oizuma, Higashi-Tagawa district, province of Uzen, bought 1895, has an area of 100 acres and forces, 1907, averaged 635 hands. The mine has a main vein of 1 to 6' width, and about 2,500' length, carrying chalcopyrite, with small quantities of tin, arsenic, antimony and bismuth, associated with pyrite, in a quartz gangue. Development is by a 1,600' main tunnel. A small smelter uses Mabuki hearths, on the same plan as the Nagamatsu smelter. Production was 264,526 lbs. fine copper and 8,067 oz. silver in 1907; 355,125 lbs. copper and 10,000 oz. silver in 1908, and has remained constant, being but 377,202 lbs. copper in 1911 and 411,203 lbs. in 1912.

The Innai mine is at Okachi, in Ugo province. This mine, with an area of about 1,500 acres, was discovered A. D. 1696, and became important about the beginning of the nineteenth century, silver production rising,

about 1840, to about 100,000 momme monthly, and was purchased, 1882, by I. Furukawa. The property shows augite-andesite and propylite, having numerous veins of 2 to 20' width, the main vein carrying chalcopyrite, pyrrargyrite, argentite and stephanite, with quartz gangue. A second vein, of 1 to 4' width, carries similar ores and in addition galena, sphalerite and pyrite, while a third vein carries chalcopyrite, galena and sphalerite only. Equipment includes a 500-h. p. hydro-electric plant, and a stamp mill. Production was 573,692 lbs. fine copper, 145,791 oz. silver and 1,603 oz. gold in 1907, and 338,820 lbs. copper, 95,942 oz. silver and 980 oz. gold in 1908, but is not separately given for recent years.

The Hirotani mine at Nishikawa-mura, Niigata-ken, Echigo, has only a 45-h. p. installation. Ore carries no appreciable gold or silver values. Production was 237,587 lbs. fine copper in 1907, and 137,053 lbs. in 1908.

The Nikko copper works, at Kamitsuga-gori, Tochigi-ken, Shimotsuke, were built, 1905, to refine the copper from the Ashio mine of the Furukawa Copper Co., and absorbed the Honjyo works, at Yanagiwaramachi, Honjyoku, Tokyo, in 1908. The smelter has 4 reverberatory furnaces, 2 with casting machines, 1 furnace being for refining blister copper not containing appreciable gold and silver values, and 1 for casting anodes. Blister copper before refining has the high average copper tenor of about 99.7%. The electrolytic refinery, of about 8,000,000 lbs. yearly capacity, uses the series system. There is an extensive wire mill, having a Bates & Peard annealing furnace, and 8 continuous drawing machines, with many single drawing blocks. Yearly production of the Nikko works is about 5,000 tons of copper wire, 2,000 tons of copper ingots, and 500,000 oz. refined silver and gold.

The management of the Furukawa Mining Co. is skilful and highly progressive. The responsible heads of departments are encouraged to travel, at the company's expense, through the principal mining and metallurgical centers of Europe and America, thus keeping the company fully abreast of international progress in every branch of its business. Recent production has been as follows: 21,599,300 lbs. fine copper in 1904; 23,780,573 lbs. in 1905; about 22,000,000 lbs. in 1906; 20,303,378 lbs. in 1907; 17,500,000 lbs. in 1908; 19,000,000 lbs. in 1909, and about 40,000,000 lbs. in 1912.

GADITANA DE MINAS; COMPANIA.

SPAIN

Office: Cadiz, Spain. Mine: Aznalcóllar, Sevilla, Spain. Capitalization 3,000,000 pesetas, shares 500 pesetas par; debentures, 2,000,000 pesetas authorized. Marquis de Fiel Pérez Calixto, pres.; D. José Luis Lacave, treas.; D. Salvador Viniegra, sec. Property is La Caridad group of mines, carrying large bodies of cupriferous pyrites, with considerable development. Company owns a 34-kilometer railroad, from Aznalcóllar to the Guadalquivir river. Property considered promising.

GALIZURSKI WORKS.

RUSSIA

Mine office: Galizursk, Zangezhur, Elizabethpol, Russia. S. Varavov, owner. This mine, in the Trans-Caucasus, has been worked intermittently since very ancient times, is on the Galisur Tschai, a tributary of and about 15 miles north of the river Arax, which is the boundary line between Russia and Persia. Ore occurs in a number of veins with prominent outcrops and traversing diabase and andesite, much crushed and silicified, and occasionally faulted. Veins are 3" to 3' in width, with nearly vertical dip, carrying sphalerite in the upper workings, which disappears in depth, ores including bornite and covellite in the secondary zone and chalcopyrite at depth. The average mineralized portion of the veins is about 8", carrying ore of about 15% average copper tenor.

The mine is developed to a depth of about 350', by 2 shafts and a tun-

nel, the opening called a tunnel being a combination tunnel, shaft, winze and stope, exceedingly erratic in direction and dip, having occasional staircases, and at times being carried through old stopes on bridges or notched timbers. Formerly ore was carried to surface in baskets and water in leather bags, but steam pumps were installed, only to be abandoned, owing to the cost of fuel, and are to be replaced by electric pumps.

Ore is hand-picked, high-grade ore, of 15 to 22% copper tenor, being sent to the smelter and middlings hand-dressed in sluice boxes by boys, to a concentrate of 15% copper tenor, balance of ore going to the waste dump. The smelter is but a little more modern than the mine. Maximum production was 1,308,796 lbs. fine copper in 1899, and recent production has been 100,000 lbs. fine copper in 1905; 45,000 lbs. in 1906; 65,000 lbs. in 1907 and 528,044 lbs. in 1908.

GALLO HERMANOS.

PERU

At Cerro de Pasco, Junín, Peru. Property is El Carmen smelter, having a 6-ton matting furnace, doing a small local custom business, at last accounts.

GATICO; COMPANIA DE MINAS DE COBRE DE.

CHILE

Office: Calle San Agustín No. 9, Valparaíso, Chile. Mine office: Gatico, Province of Antofagasta, Chile. Guillermo Rivera, pres.; Karl Huttman, vice-pres.; Charles W. Evans, Adolf Walbaum and Luis Claro Solar, directors; Arturo Frontaur, sec.-treas. and gen. mgr. of company; Geo. D. Waters, gen. mines mgr.; Frank D. Aller, gen. smelter mgr.; Daniel Carrazana and Celedonio Zuniga, mine supts.; Ernesto Rojas, chemist-assayer; Victor Medina Mesa, purch. agt.; Julio Arnado, mg. engr. Organized June 14, 1911, under laws of Chile, capitalization £275,000, shares £1 par; fully paid and issued. Dividend paid April, 1913, 5d. per share, another of same amount to be paid shortly. Shares listed on Santiago and Valparaíso exchanges. Net profits, 5½ months, 1911, were \$181,773.17; in 1912, \$511,459.90 pesos of 10d. each.

Property consists of the Toldo and Michilla groups aggregating 125 claims, 453 hectares, including 4 principal developed mines, also a 15-hectare smelter site, all in the Gatico district in the vicinity of the sea.

The claims held under government concession, include 2 groups of prime importance, 1 being the Mina Toldo, at Gatico, and the other the Michilla group. Other properties of importance or promise are the Vellarde, Crimea, Argentina, Santo Domingo, Carolina and California mines. Properties as a whole carry 14 veins of importance, with 8 under development. Management estimates that the mines as a whole average about 8% copper, 0.2 oz. silver and one-half gram gold per metric ton, ores being mainly chalcopryrite, with some bornite. Mines as a whole have 11,128 meters of workings with 45,000 metric tons of ore blocked out for stoping. The principal mines were opened, 1830, closed, 1861, and reopened, 1887.

The Toldo mine, at Gatico, 4 kilometers northeast of the smelter, on the first mountain range overlooking the sea, is favorably situated for economical operations on a considerable scale. Country rock is syenite, carrying a fissure vein of about 3' average width, with nearly vertical dip, ore occurring in strong shoots, of great persistence, with cross veins causing increase of mineralization at points of intersection. Ore is a chalcopryrite and bornite with \$1 in gold per ton and a trace of silver. The ore is entirely free from zinc, lead, antimony and barite, with gangue mainly of quartz and a little feldspar. The zone of oxidation, about 100 meters in depth, is succeeded by a secondary zone carrying silicates, brochantite and a little native copper, but with no secondary sulphides, the secondary

zone being succeeded directly by chalcopyrite, associated with a little pyrite. The Toldo mine has 3 shafts, 340 meters from one another, deepest 1,400', with 16 levels opened at approximately 25-meter distances. The mine is opened for a length of 1,500 meters, including the workings on the 574' Velarde shaft, which mine is an extension. The mine requires very little timbering and water appears in small quantities at depth of 125 meters. Total workings, 40,000'. The Toldo and Velarde mines are estimated to have in sight better than 51,000 metric tons of ore, averaging above 8% copper, and employ 235 men, miners working 8-hour shifts, on contract, producing an average of 800 kgs. ore per man per shift, with average daily earnings of 7 pesos, which is good work and high pay.

Equipment at the Toldo mine includes a 75-kw. hoist at the main shaft, good for 800 meters depth, raising 1,100-kg. cages at a velocity of 600 meters per minute. There is a Rand air compressor, driven by a 60-kw. motor, and the mine uses air-hammer power drills, and is experimenting with Murphy and Holman stope drills. El Toldo mine is connected with the smelter by a 3,644-meter Ropeways aerial tram, having 19 towers, highest 20 meters, with longest span of 433 meters and drop of 372 meters, carrying 160-kg. buckets, with hourly capacity of 5 metric tons, operated by electric power, assisted by gravity. Cables last from 2 to 3 years, and cost of transportation is only about 1 peso per metric ton, one-half being for upkeep.

The Michilla group includes the California, Carolina and Eduardo mines, at an elevation of 1,000 meters above sea-level, 6 kilometers east of Michilla cove, and 15.6 miles south from Gatico. Lodes of this group are flat bedded veins in andesite porphyry, the dip averaging 30'. They vary greatly in width, ranging 1 to 15 meters across, carrying ore in bunches. The vein of the California mine, of about 5 meters average width, yields ore that, with selection, averages about 5% copper, this mine having a 20-meter vertical shaft. La Carolina mine is opened to depth of only 80 meters, with horizontal length of 300 meters, workings being entirely in oxidized ores. La Carolina has oxide, sulphate, silicate and oxychloride ores, all soluble in weak acids, gangue being porphyritic and insoluble. The greatest part of the ore is brochantite with smaller quantities of atacamite, chrysocolla and copper oxides. The mine requires no timbering, and this and the adjoining mines of the Michilla group show about 80,000 metric tons of 5% ore, all ore under 4% tenor being discarded. Production, 1912, was about 775 metric tons monthly of ore averaging 5.63% copper.

The Michilla mines have a 5,331-meter Bleichert aerial tram to Michilla Cove, with 50 towers, highest 25 meters, longest span being 359 meters. The line carries 300-kg. buckets and has an hourly capacity of 20 metric tons. There are 2 intermediate tension stations and, by reason of the heavy drop of 929 meters, or nearly 1 in 5, about 50-kw. in electric power is generated automatically, with a hydraulic regulator, only 5 operatives being required for the line. The tram, in commission 1908, cost about £11,000 in Europe, and approximately £20,000 installed. Ore is shipped from Michilla Cove to Gatico by lighters.

The smelter, at the port of Gatico, 30 miles south of Tocopilla, and 60 miles north of Antofagasta, has two 38x140" blast furnaces, 1 held as a spare, using sea water for jacket and burning Westphalian coke, costing 30 to 65 pesos per metric ton. A nearby limestone quarry provides flux brought in wagons. Mineral charges are about 40% lump sulphides, 30% briquetted sulphides from the Toldo and 30% oxidized ores from La Michilla, to which are added 30 parts of flux and 30 parts of slag for remelting, a total of 160 parts, requiring 17 parts of coke for smelting.

Product is a matte of 45% average copper tenor, carried in metal launders to the converters. Slags, assaying 0.35 to 0.5% copper, are dumped into the sea, granulation not being practicable.

The converter department has 4 stands with eight 57x81" barrel-type shells, built in the shops. Shells are rotated by hand, but there is a hydraulic accumulator for later installation. Converter product is Chile bars averaging about 98.9% copper, 2.6 oz. silver and 0.7 oz. gold per ton, shipped to England for electrolytic refining.

The briquetting plant, with a Chisholm, Boyd & White press, takes fines from the Toldo ores, and flue dust, using distilled sea water, briquettes going to the blast furnaces. There is a small experimental leaching plant treating La Carolina ores and consideration has been given to adding an acid plant to provide leaching material.

The power plant includes three 200-h. p. Babcock & Willcox boilers, a 200-h. p. electric motor-generator set, a 120-h. p. Allis-Chalmers duplex air compressor for the converters, a Connersville blower direct-connected to a 60-h. p. Erie Iron Works engine, for the blast furnaces, and a 120-h. p. Williams-Foster engine in reserve. There also are minor engines for the briquetting plant, machine shop and electric light. Australian coal costing 30 to 50 pesos per ton is used.

Owing to the aridity of the district it was necessary to solve the water question by a distillation plant, furnished by the Mirrielees-Watson Co., Ltd., which has a capacity of 140 metric tons of distilled water daily. There are 2 pumps of 60 metric tons capacity hourly. Sea water is used for condensing steam, after which it passes through the water jackets of the blast furnaces. The water plant includes a reservoir of 50 cubic meters capacity.

The shops are very complete, being capable of repairing and, if necessary, replacing all machinery parts at the mines and smelter. Shops include an iron foundry, pattern shop, carpenter shop, boiler shop and a small brass foundry, and there also is a complete chemical laboratory.

Transportation facilities include 3 piers, and a 38-ton tug makes daily round trips between Michilla Cove and Gatico, towing four 30-ton ore lighters. A 1,600-meter private railway, with 2 locomotives and 25 cars, connects the smelter and wharves. The company maintains a physician for employees and their families, and 3 schools.

Production has been as follows: 3,127,512 lbs. fine copper in 1907; 3,450,810 lbs. in 1908; 4,097,095 lbs. in 1909; 4,047,104 lbs. in 1910; 4,116,298 lbs. in 1911 and 3,871,438 lbs. in 1912, decrease due to cloudburst and floods at Toldo. Estimated output for 1913, 4,365,000 lbs. The property is considered valuable, and the company is progressive and well-managed.

GEISSE; SUCESIÓN FRANCISCO

CHILE

Idle. Mine at El Espino, Combarbalá, Coquimbo, Chile. Property includes El Espino mine, opened 1896, which produced about 100,000 lbs. fine copper yearly when working, and the Fundición El Pupio, a small smelter.

GEISSE HERMANOS.

CHILE

Mine at Illapel, Coquimbo, Chile. Works office: Tocopilla, Coquimbo, Chile. Property includes the Bella Vista, Las Trabos and Tongoi mines. The Bella Vista mine is about 150 meters deep, with workings for about 150 meters in horizontal length. The Tongoi mine, at Mineral de Tongoi, Illapel, has a vein of 2 to 3 meters width, opened to depth of 160 meters and, 1903, employing 90 men, produced 900 metric tons of ore, averaging 9% copper and 25 grams gold per ton. Los Trabos mine in the same year produced 720 metric tons of ore of 20% copper tenor.

Property includes the Fundición de Illapel, producing only 23,734 lbs. fine copper in 1908 and 42,030 lbs. in 1909, but 1,746,164 lbs. copper in pigs

of 50% matte and 86,587 lbs. copper in bar copper, 97% fine was produced, 1910; also the Fundición de Porvenir, at Tocopilla, which has a blast furnace, and several reverberatories of about 30 to 40 tons capacity each. This smelter is said to have worked under some difficulties latterly. Production is matte of about 50% copper tenor, and Chile bars averaging 97% copper, with considerable silver and gold values, exported for refining and parting the precious metals. Production was 523,974 lbs. fine copper in 1908 and 426,288 lbs. in 1909.

GERALDINE COPPER & LEAD MINES, LTD.

ENGLAND

Manager and offices: J. Sullivan, 18 Ironmonger Lane, London, E. C. England. Organized Oct., 1912, capitalization £60,000, shares 10s. par. Company formed to acquire and deal with mining properties.

GERTRUDIS; MINA.

PERU

Owned by the Morococha Mining Co., which see.

GIPPSLAND COPPER, PLATINUM & GOLD MG. CO. TASMANIA

Office: 60 Queen St., Melbourne, N. S. W., Australia. H. B. Black, chairman; P. E. Käpel and Dr. H. Friedman, directors. Organized under laws of Victoria, 1911, succeeding a company of same name formed in Tasmania. Capital £16,250, shares 5s. par. Report of Sept., 1912, showed liabilities, £6,273; liquid assets, £1,682. Government assistance of £1,500 was asked in March, 1913.

Property consists of claims on Cooper's creek, near Thomson river, close to Walhalla, Tasmania. Ore deposit is a hornblende diorite dike in sedimentary slates and quartzites carrying chalcopyrite mixed with hornblende in bunches and streaks. Mine 300' deep with reserves estimated, 1911, at 76,000 tons, carrying 4% copper and 5 dwt. platinum. Deposit was drilled by government some years ago, a 37° hole showing 102' of ore. Property has 60-ton smelter and 1½-mile tram to Moe-Walhalla railway. Production, 1911, 700 tons yielding 43½ tons matte, worth £22 13s. per ton and carrying 38.7% copper, 7.464 oz. silver, 0.645 oz. gold and 1 oz. 16¾ dwt. platinum.

Property was boomed and shares sold as high as 16s. but manager now reports that ore cannot be profitably smelted without 15s. iron ore. Company also owns the Happy-Go-Lucky gold mine 3 miles from its copper property which is also a failure. Receivership seems likely.

GIRILAMBONE COPPER MNG. CO., LTD. NEW SOUTH WALES

Idle. Office: Sydney, N. S. W., Australia. Mine office: Girilambone, Canbelego Co., N. S. W., Australia. G. A. Richards, mgr.; W. Blakemore, mine mgr., at last accounts. Was organized under this title, reconstructed, Feb., 1902, under title of Girilambone Copper Mining Co., N. L., and reorganized, 1907, under the original title. Debentures, £12,400. While company is not officially in liquidation, the mine is at the mercy of debenture holders as no interest has been paid for 3 or 4 years. Being a no liability company, liquidation proceedings can only be started by the action of some creditor.

The mine, opened 1880, carries numerous quartz veins and intrusions, ore occurring mainly as disseminations and replacements, lacking clearly-defined walls, in arenaceous slate and sandstone having occasional hard bands of quartzite, ore being mainly sulphide, with quartz gangue, though the mine carries considerable carbonate ore of high grade, in the oxidized zone, of about 200' depth. Main shaft is 544'. Ores are divided into 3 classes for treatment, the first comprising carbonates and cuprite of about 4.6% average tenor, second class ore being composed of oxides from the transition zone, while sulphides from the lower workings constitute the

third class, each being smelted separately. Average of all grades, 1900, was 3.85% copper.

The smelter has 2 reverberatory furnaces and a refining furnace, turning out blister copper of the remarkable purity of 99.95%. Ores are difficult of reduction owing to their deficiency in sulphur and iron and excess of silica. Water is very scarce, the property having a dam and filtering and reusing the water repeatedly. The reduction plant includes lixiviation works, where tailings and certain low-grade oxidized ores are leached. Magnetic separation was tried in 1901.

The property was reopened, 1906, employing 60 men, and smelted 6,035 long tons of ore, yielding 293,440 lbs. fine copper. No work has been done since 1909.

GLADSTONE MINE.

NEW SOUTH WALES

Wrightville, Robinson Co., N. S. W., Australia. Lands, 2 miles south of the Great Cobar mine. Described Vol. X. Probably idle. No returns secured.

GLAMORGAN COPPER OPTIONS SYN.

NEW SOUTH WALES

Organized, 1912, in Sydney, N. S. W., Australia, capitalization £10,000, shares £10 par. F. G. Parish, H. Richardson and A. E. Ellis, directors. Property at Gordon Brook, Clarence river, N. S. W., developed by several shafts of 50 to 100' depth, said to expose promising orebodies.

GLASSFORD CREEK MINE.

QUEENSLAND

Mine office: Glassford Creek, Curtis Co., Queensland, Australia. W. C. Willcocks and Jas. Stewart, leasers. Lands, leasehold, include the Blue Bag mine, discovered 1897, in the Dawes range. Nearest rail point is Gladstone, 35 miles north. Mine was developed opencast, but this system was abandoned, 1907, for underground workings, by tunnel and a 75' shaft. Mine has a contact vein of 30 to 100' width, with slate foot and granite hanging, carrying sulphide ores. Mine idle, 1912, due to lack of capital and Blue Bag workings flooded.

The reduction plant includes a 300-ton Blake-Marsden crusher and picking tables. The smelter, near the mine, has a small reverberatory furnace and a 100-ton rectangular blast furnace, installed 1906, with a Connersville blower, making matte of 40 to 45% copper tenor, with slags averaging 0.3%. Production, under old ownership, secured with an average force of 183 men, was 913,366 lbs. fine copper, 13,699 oz. silver and 4,715 oz. gold in 1906, and was 787 long tons of ore, yielding 223,200 lbs. fine copper, 3,576 oz. silver and 653 oz. gold in 1907, giving an average extraction of about 2% copper, 0.75 oz. silver and 2.75 dwts. gold per ton. Production was suspended October, 1907, and the old company liquidated, property passing into the hands of present leasers, on the basis of their assumption of both assets and liabilities, latter about £30,000.

GLORIA DEL INCA; COMPAÑIA MINERA.

CHILE

Idle. Mine near Chañaral, Atacama, Chile, and Copiapó, Atacama, Chile. Organized Oct. 25, 1906, under laws of Chile, capitalization £20,000, later increased to £30,000. Property is 3 groups of mines, 2 in the Mineral del Inca district, and 1 in the Mineral del Chivato district.

The Fortuna group, 8 claims, 12 kilometers from San Pedro Nolasco, on the Chañaral railway, at an elevation of 2,000 meters above sea level, shows porphyry, with andesite dikes, developed by the Fortuna tunnel, driven by former owners, and carries 2 practically parallel veins, known as the Fortuna and Fortunita, latter being crossed by the Crucero vein. The Tres Puntas group includes the Dos Hermanos mine and the Sierra del Chivato group, of 7½ acres, south of Estación Angostura, on the Chañaral railway.

GLÜCKAUF-NEVIGES; GEWERKSCHAFT VEREIN. GERMANY

Mine at Neviges, Rheinprovinz, Prussia, Germany. Chr. Weuste, L. Kannengeiser, G. Engels, Herman Heymann and Herr Tilmann, directors; Julius Leverkus, mgr. Organized under laws of Germany, capitalization 1,000 shares, without assigned value.

Mines carry lead and copper ores, developed by 2 shafts, and produce 17,000 metric tons of ore yearly, with values mainly in lead. The mines have a small concentrator producing about 12,000 tons crude ore yearly at last accounts.

GOLDBACH; GEWERKSCHAFT.**GERMANY**

Idle. Office: Oberrossbach, Nassau, Germany. Mine at Siegen, Westfalen, Germany. Ernest Giebler, gen. mgr.; Herr Bluner, supt., at last accounts. Organized 1898, under laws of Prussia, capitalization 100 shares, without assigned value. Mine, near Haiger, developed by tunnels, has about 450 meters of workings, on a 30" vein carrying chalcopryrite giving assays of 20 to 30% copper.

GOLONDRINAS; MINA DE.**BOLIVIA**

Idle. Owned by Sr. Pedro Bogge. Property in Callapa Canton, Province of Pacajes, Bolivia, 80 hectares, carrying 2 copper-bearing veins 25 to 36" wide, averaging 75% copper. Developed by shaft.

GOMEI-KWAISHA FUJITAGUMI.**JAPAN**

Is the Japanese title for the Fujita Co. owning the Kosaka and other mines, described under Fujita Co.

GONZALEZ; SUCESSION P.**CHILE**

Idle. Works at Labrar, Freirina, Atacama, Chile. Property is a matting furnace built 1900, which formerly produced 1,250,000 lbs. fine copper yearly.

GOODRICH PROPRIETARY.**NEW SOUTH WALES**

Idle. Mine office: Yeoval, Gordon Co., N. S. W., Australia. F. Pearce, mgr., at last accounts. Mine, 5 miles from Yeoval, known, at various times in the past, as the Buckenbar, Gordon and Yeoval, was opened 1868, and first worked for gold, but gold being succeeded, at depth of only 30' by chalcopryrite, the property was worked as a copper mine for several years and had a smelter, said to have produced about 225,000 lbs. fine copper and 130 oz. gold per month. Later the mine was worked again for gold only, and, 1886, had a 20-stamp battery. Mine was reopened 1898 and taken over, 1903, by the present company.

The mine has a quartz vein in granite, of 4 to 8' width, carrying a little malachite and magnetite near surface, succeeded by auriferous and argentiferous chalcopryrite, associated with magnetite, and also has a pipe-vein, about 300' in diameter, showing ore assaying up to 18% copper and 4 oz. gold per long ton. Development is by a large open pit and a 300' shaft. Underground workings have given much trouble in the past from caving. Mine is said to have about 20,000 tons of strongly auriferous copper ore in sight. No recent returns secured.

"GOROB"; DEUTSCH S. W. AFRIKANISCHE**KUPFERMINENGESELLSCHAFT.****GERMAN S. W. AFRICA**

Idle. Office: Berlin, Germany. Mine office: Gorob, German S. W. Africa. Max Schöller, chairman; preceding officer, Max Müller, Herr Hanemann, Herr Walther, Herr Steinweg, Herr Mohr, Albert Weil and Otto Erhard, directors; Herr Huser and Herr Etting, mine mgrs. Organized under laws of Germany, capitalization 400,000 marks, shares 100 marks par. Development consists of 1 shaft, of 50 meters depth. No recent returns secured.

GOSSAN MINE.**QUEENSLAND**

Owned by Carmen & Sons. Has opened up a substantial width of profitable ore in tunnel, March, 1913.

GOULMA COPPER OPTIONS CO.**NEW SOUTH WALES**

Organized in Sydney, N. S. W., in 1912, capitalization £5,000, shares £10 par.

GRAFTON COPPER MNG. CO., LTD.**NEW SOUTH WALES**

Secretary's address: P. O. Box 3, Grafton, N. S. W., Australia. Mine office: Cangai, Drake Co., N. S. W., Australia. Samuel See, chairman; Peter Kritsch, managing director; preceding officers, Wm. Zietsch and Geo. Henry Varley, directors; Wm. McNeill, sec.; Jas. Newton, underground mgr.; Wm. Hughes, smelter foreman; Geo. H. Blakemore, cons. engr., at last accounts. Organized Jan. 29, 1906, under laws of New South Wales, capitalization £80,000, shares £1 par; fully issued and fully paid. Dividends were £11,000 in 1907; £4,000 in 1909, and £5,000 in 1910, a total of £20,000. Net earnings were £6,080 in 1909. Shares are listed on the Sydney Stock Exchange. Annual meeting, last Tuesday in January.

Lands, 7 claims, leasehold, with 10-acre mill and smelter site, 26 miles by bullock tram to Copmanhurst, with water transportation from that point. Property carries 4 fissure veins, in felsitic tuffs, of which 3, under development, are estimated by management to average 10' width and 400' in proven length. The main vein has an ore channel, with nearly vertical dip, carrying shoots, 1 to 13' wide, of chalcopryite, with a little malachite and azurite in the upper workings, ore averaging about 10% copper, 0.58 oz. silver and 18 grains gold per long ton. The South Lode, of 3 to 10' average width, carries up to 6' of massive chalcopryite. The mine, opened 1905, has several shallow shafts, but development is mainly by tunnels; A, 1,305', showing 15.6% copper ore, full width of working; 5 other tunnels are also driven with a total of about 4,500' of workings. Ore blocked out Dec. 31, 1911, 19,000 tons averaging 10% copper. All mining is done by hand-work. Ore is taken by gravity trams from the mouth of the main tunnel to ore-bins and thence by carts to the smelter. Produced, 1911, 8,170 tons of ore carrying 10.3% copper. Development for year 1911, 1,474'. Mining and development costs £1 2s. 2d.

The 60-ton smelter, $1\frac{1}{4}$ miles from the mine, has four 15-ton reverberatory furnaces and began smelting May, 1906. Sulphide ore is roasted in heaps of 100 to 200 tons, requiring 6 to 8 weeks, according to size. Smelter produces first matte about 30%, roasted and resmelted to 63%; matte averaging about 63% copper, 5 oz. silver and 4.5 dwts. gold per ton, sold in Sydney, for export to Germany. Fuel is wood, costing 15s. per cord, with a yearly consumption of about 10,000 cords, and the supply is somewhat uncertain, with a precarious water supply also. Company plans a 4-mile fuel tramway at a cost of about £8,000.

Production was 790,840 lbs. fine copper in 1907; 1,149,120 lbs. copper, 3,994 oz. silver and 249 oz. gold in 1908; 1,630,720 lbs. copper, 7,058 oz. silver and 352 oz. gold in 1909; 1,836,800 lbs. copper in 1910; 1,609,548 lbs. copper, 217.7 oz. gold and 5,002,272 oz. silver in 1911. Property considered valuable and management good.

GRASLITZER KUPFERBERGBAU.**AUSTRIA**

Idle. Mine at Eilenberg, Bohemia, Austria. Mines, which are very ancient, and were one of the principal sources of European copper supply during the Middle Ages, show a vein of 12 to 15' width, in clay-slate. Mines were reopened, on a considerable scale and a new smelter built, 1901.

GREAT AUSTRALIAN FREEHOLD COPPER CO. QUEENSLAND

Address: Cloncurry, Queensland, Australia. Company has closed down

property after an expenditure of £137,000 because of a royalty of 5% of the value of the ore broken and a second royalty of 5% of the value of the copper produced, which makes it impossible to work the property at a profit. Government officials are seeking some means of compelling the freehold owners to reduce the royalty in order that the mine may be worked, the property being considered a valuable one.

GREAT AUSTRALIAN MINE.

QUEENSLAND

Owned by Queensland Exploration Co., Ltd.

GREAT CARPENTARIA COPPER

MINING CO.

NORTHERN TERRITORY

Address: Maude via Katherine, Northern Territory, Australia. Mr. Brooks, mgr. Company owns several claims near the above address on which 4 large outcrops show copper carbonate ore. There are 2 main veins traceable for one-half mile, and varying up to 200' in width. The property was producing high-grade oxidized ore in 1912 and prospecting disclosed massive bodies of copper pyrite and gray copper. The federal government made a grant of £2,500 on the usual terms that the company should spend an equal amount in deep development.

On the south lease a 100' vertical shaft will be sunk with a crosscut and on the north lease a 200' tunnel will be driven to cut the 8' vein shown on the surface. The ore carries from 6 to 40% copper and up to 7 dwt. gold per ton.

GREAT COBAR, LTD.

NEW SOUTH WALES

Office: 65 Broad St., London, E. C., England. Mine office: Cobar, Robinson Co., N. S. W., Australia. Works office: Lithgow, Cook Co., N. S. W., Australia. Andrew Haes, chairman; R. H. Henning, F. A. Robinson, Gerard B. Elkington, J. P., G. E. Baker, W. Pellew-Harvey, W. R. Stephenson and W. I. Barnett, directors; Alex. Johnston, sec.; H. C. Beljinger, gen. mgr.; Geo. A. Laird, gen. supt.; Nicholas Treloar, mine supt.; T. J. Murphy, smelter supt.; Percy Penman, mg. engr.; T. J. Thibault, chemist assayer; W. Mitchell, purch. agt.

Organized May 22, 1906, in Great Britain. Capitalization £1,000,000, shares £5 par; 186,542 issued and fully paid. Capital increased from £750,000 to £850,000 to acquire Cobar Mines, Ltd., July, 1910, and to present amount Oct., 1910. Debentures, £750,000, (£724,800 outstanding) first-mortgage 6% bonds, in denominations of £20, £50 and £100, redeemable by drawings at 5% premium, but repurchasable by means of a sinking fund, created 1908, by setting aside £100,000 annually, from profits. Paid a 15% dividend, of £112,500, Sept. 16, 1907.

Gross profits for the year ending June 30, 1912, were £168,691; out of this the directors wrote off £23,941 for depreciation, £15,338 from development, £8,407 from shafts and £43,161 from the underwriting and organization account, once £181,264, now reduced to £50,000 and since entirely wiped out. Balance carried forward £34,356.

Ore reserves June 30, 1912, were 2,777,610 tons, being 1,813,087 tons of 2.6% copper ore in the Great Cobar mine, 662,349 tons of 2.6% copper ore in the Chesney mine and 302,174 tons in the Cobar gold mine. Property examined and favorably reported upon in 1912 by C. S. Herzig.

Company took over the property of the Great Cobar Mining Syndicate, 1906, for £1,006,000, of which £800,000 went to the owners, the promoters taking £206,000 in cash, shares and debentures. The property of the Cobar Gold Mines, Ltd., was bought, July, 1910, for £100,000.

Lands, 3,575 acres, of which 1,323 acres are freehold, including the Great Cobar mine, area 208 acres, leasehold; the Cobar gold mine, area 108

acres, leasehold; the Cobar Chesney mine, area 198 acres, half freehold and half leasehold; the Great Peak and Conqueror gold mines, at Cobar; the Rix's Creek Colliery and coke works, at Singleton, and smelting and refining plants at Cobar and Lithgow.

The Great Cobar mine, the most important copper producer of New South Wales, was opened in 1869, and closed down in 1892, failing to smelt sulphides in a reverberatory furnace. Production, 1869-1892, was 26,611 tons fine copper, made from rich oxides, ores averaging 11.07% in copper tenor and considerable dividends were paid therefrom. Mine was reopened, 1892, by tributors, on a 10-year lease and, at the close of 1902, had produced under their management, 730,669 tons of ore giving average returns of 3.27% copper. A long-standing dispute between the tributors and the fee-owners was settled, 1903, through the purchase of the property by the former, who sold to the present corporation.

Country rock, of Silurian slate, carries 3 veins of nearly vertical dip known variously as the East, Middle and West lodes, but only the West lode has been productive thus far. This vein varies from 6' to 52' in width and carries lenticular orebodies. One of the principal parallel mineral zones is basic and the other acid, these lying about one-half mile apart. The principal ore shoots are 28', 38' and 52' in extreme width, with lengths of 135', 345' and 485', proven to depth of 1,500'. The oxidized zone extends to an average depth of about 250' succeeded by rich chalcopryrite ore to a depth of 400'; below this the ore gradually becomes leaner. The copper occurs in chalcopryrite, associated with pyrite and magnetite, with occasional pyrrhotite, of about 3.5% average copper tenor in the Cobar and 2.81% in the Chesney carrying an average of 0.5 oz. silver and 1.5 dwts. gold per long ton. Ore is mined by overhand stoping, with 10' pillars left beside the shafts, and timbering is by "pigstye," or bulkhead system. Ore is first broken in immense masses, then reduced to smaller size by block-holes and pop-shots.

No. 1, the main shaft of the Great Cobar, is 16x8' in size, 1,540' deep, with bottom level at 1,520'. The Barton shaft is 1,060' in depth, and these shafts are connected on the 1,060' (or No. 10) level. The mine has upwards of 3 miles of workings and the orebody shows no sign of decreasing width or value at depth. Ore reserves were estimated, June 30, 1912, at 1,813,087 long tons, being 328,193 tons less than in 1911, largely the result of the adoption of a lower specific gravity factor in calculations, and offset by 350,000 tons of probable ore not figured in former calculations, averaging 2.6% copper. New levels are to be opened at 150' intervals and it is estimated that each level should develop about 600,000 tons of ore. No. 1, the main shaft, has 2 hoisting compartments, using cages and trucks, raised by a Corliss hoist. The headgear, 67' high, and shaft house are of structural steel, latter with brick walls. Buildings at the mine include a power house, boiler house, repair shops, machine shop, smithies, office and miscellaneous structures.

The Cobar Chesney mine, area 198 acres, half freehold and half leasehold, has a 900' shaft, and at depth of 460', shows a 40' vein, carrying 2.5 to 4% copper and 2.5 to 3 dwts. gold per ton. The mine has 700,000 long tons of 2.6% ore blocked out, furnishing 20 to 35% of the total ore production of the property. The Cobar Chesney was opened as a gold mine, the outcrop carrying no copper, but carbonate copper ore was found at depth of 155' and at 250' depth there was chalcopryrite, coated with what was termed melaconite, but which probably was chalcocite. The Cobar Chesney is worked in connection with the Great Cobar, and on the 464' level shows a lenticular ore shoot 25' wide and about 600' long that carries

chalcopyrite, with slate and quartz gangue. The Cobar Chesney has a 500-ton concentrator.

The Fort Bourke ore, richer in gold, has partly supplanted the Chesney as a source of silicious flux.

The Cobar Gold mine, often called the Fort Bourke, area 123 acres, leasehold, also has 50 acres of water rights, and a 50-acre mill site. Ore is sulphide, averaging 1.25 to 1.30% copper, and 10 to 11 dwts. gold per long ton, but carries much barite in the gangue, and the presence of copper renders cyaniding difficult for gold recovery, while the low percentage of copper renders direct smelting unprofitable for that metal. Ore reserves were estimated, June, 1912, at 300,000 tons of 1.5% copper, and nearly \$10 gold. The mine was idle from Sept., 1908, until taken over, July, 1910. The purchase of the Cobar gold mine was advantageous to both seller and purchaser.

The Peak and Conqueror gold mines are 6 miles from Cobar. The first named, a steady producer for 18 years, is now being developed. The ore is silicious and free from iron and sulphur and is a desirable flux for the basic ores of the Cobar group.

The mining plant, shops, smelter and yards of the Great Cobar cover a tract of about 80 acres. The entire works have been remodeled and brought up to date under the able management of Mr. H. C. Bellinger.

The mill of the Cobar gold mine has 100 stamps, a cyanide plant and slimes plant. An Elmore oil flotation plant, while technically successful did not give satisfactory work in connection with the old mill.

The mining plant includes a 500-h. p. first-motion hoist, good for 2,000' depth, at No. 1 shaft, and two 25-drill air compressors.

Electric power is used almost exclusively, upwards of 3,000 h. p. being required for the mine and works. The new power house, adjoining the smelter building, is exceptionally well designed and complete. The building is of steel, with brick walls. There are two 20-ton overhead traveling cranes, reaching the full length of the building. Electric power is furnished by three 300-kw. 3-phase 50-cycle 400-volt alternating current generators, mounted directly upon the shafts of 3 Corliss cross-compound condensing engines, of which 1 is a spare. There are two 250-kw. motor-generator sets, operated by current from the main generators, supplying direct current at 240 volts for the operation of the cranes, converter stands, and minor motors about the plant. There are two 2,500 cu. ft. air compressors, furnishing power for the rock drills and air hoists. Four Connorsville blowers, each direct-connected to a Corliss tandem-compound engine, furnish blast, at a pressure of about 45 oz., each blower being connected independently with its own blast furnace, a cross-connection header, with suitable valves, permitting blast from any blower to be directed to any furnace, or the pressure of all blast mains to be equalized. A Corliss duplex cross-compound air compressor, with capacity of 10,000 cu. ft. of free air per minute, at 15 lbs. terminal pressure, supplies air to the converters. All engines and blowers are set staggering. The boiler room has six 500-h. p. Babcock & Wilcox water-tube boilers, with self-contained superheaters, and Green fuel economizers, delivering steam at 170 lbs. throttle pressure. Boilers are charged by chain-grate stokers, taking coal from steel bins overhead, these having a pan-type conveyor running the full length of the boiler room, over the coal pockets, and outside of the boiler room, under a receiving hopper, into which coal is discharged from railroad cars. The same conveyor, upon its return, runs under the boiler room, and ashes from the grates are discharged into a steel hopper at one end of the building located over railroad tracks, and ashes are removed by rail.

The district being arid, dry seasons causing much trouble from lack of water, dams totalling 220,000,000 gals. capacity have been built, water cost averaging about 8s. per 1,000 gals.

The frame sampling mill, for custom ores, has 50 tons hourly capacity, taking every fifth car. Equipment includes a No. 5 and No. 3 gyratory crushers, 2 Heclon crushers, of 120 tons hourly capacity, 2 sets of 24x14" belt-driven rolls, and two 28" and one 42" Simplex automatic samplers, the final sample consisting of 1 part in 1,500. Ore from the sampler is delivered to electrically driven belt conveyors, leading to a 1,500-ton ore bin, whence ore is loaded into 30-ton cars, and drawn by electric locomotives to the main storage plant. New ore bins of 12,000 tons storage capacity were built 1910.

The new smelter, of upwards of 1,200 tons daily capacity, has cost about £150,000 complete. Equipment was furnished by the Power & Mining Machinery Co., and the design is good, but not well adapted to the work and nearly broke the company, until the appointment of Mr. Bellinger who brought order out of chaos. The furnace building, near the mine, has corrugated iron roof, but no steel walls. Ore is taken from 12,000-ton storage bins in hopper-bottom cars hauled by electric locomotives on tracks of standard gauge, charging being done from V-shape side-dumping cars running on 36" gauge tracks on either side of all furnaces at the charging-floor level. Slags are handled in 25-ton ladle cars, electrically dumped, with alternative hand-dumping, there being car tracks on either side of each settler. There are four 56x240" blast furnaces, each with 40 tuyeres, set end to end, 1 being held as a spare. There are four 18' circular steel settlers, 1 between each 2 furnaces and similar settlers at the outer ends of the 2 end furnaces, giving each blast furnace an alternative discharge at either end and also providing an extra settler in case of trouble. About 9% coke charges are used.

The reverberatory department is now dismantled. The converter department has two 40-ton electric traveling cranes, of 50' span, running the entire length of the smelter building. There are 3 stands, electrically rotated, having 84x126" shells of the Copper Queen barrel type. Silicious gold ores from the Cobar gold mine are now used, instead of barren quartz, for linings. Converter ingots are sent to American refineries.

The Lithgow refining works, 370 miles by rail from the mine, include an old smelter with five 110-ton water-jacket blast furnaces and reverberatories. The principal feature is a 672-tank electrolytic refinery, installed 1902, which also does a general custom business, having a daily capacity of about 25 tons of finished copper. Tanks are of 2" Oregon pine, lined with 6-lb. lead, and inner-lined with 1" redwood, all woodwork being boiled in paraffine for 1 hour without the use of pitch or bitumen. There are 7 depositing dynamos, 2 caring for 144 tanks each, and 3 caring for 128 tanks each, the tanks for each dynamo being arranged in 4 long rows, each row having 3 terraces and each terrace a separate feed of electrolyte, tanks being stepped down 3" to insure proper circulation. Electrolyte from the collecting sump is elevated by air-jet into the storage tanks for recirculation.

From 1876 to 1906, inclusive, the Great Cobar mine yielded 1,592,895 long tons of ore, returning 138,593,280 lbs. fine copper. Production, under the former ownership, was 7,000,000 to 9,000,000 lbs. copper yearly, having been 9,027,200 lbs. fine copper in 1906, and production by present company has been about 10,000,000 lbs. in 1907; 10,586,240 lbs. copper, 64,949 oz. silver and 13,002 oz. gold in 1908; 12,762,080 lbs. copper, 83,208 oz. silver and 14,452 oz. gold in 1909; 13,847,680 lbs. copper, 107,932 oz. silver and 21,524 oz. gold in 1910. Production for the year ending June 30, 1912, was 339,494

tons of ore from the company's own mines and 88,924 tons of custom ore, producing 15,089,760 lbs. copper, 178,938 oz. silver and 37,696 oz. gold.

Some serious mistakes were made in the earlier stages of this company's career and operations were so hampered, 1909-10, by the New South Wales coal strike, that the property was idle from Nov. 4 until the end of 1910. Despite the initial mistakes the company now seems in a safe position and should soon have a productive capacity of 22,000,000 lbs. fine copper yearly, with 40,000 oz. gold and 200,000 oz. silver.

GREAT COBAR NORTH, LTD.

NEW SOUTH WALES

Address: Thos. Carter, liquidator, 26 Victoria St., London, S. W., England. Liquidated March, 1913, and new company formed under title North Cobar, Ltd., capitalization £350,000, shares 5s. par. Shareholders will receive three 5s. shares in new company for each fully paid share of the old. Each new 5s. share will be credited with 4s. 3d. paid up. Balance of 350,000 shares will be held in reserve.

GREAT FITZROY MINES, LTD.

QUEENSLAND

Office: Collins House, Melbourne, Australia. English office: 20 Copthall Ave., London, E. C., England. Mine office: Mt. Chalmers, via Rockhampton Co., Queensland, Australia. J. L. Wharton, chairman; Major Philip Charley, W. J. Loring, G. P. Doolette, and C. B. Jessop, directors; J. M. Stokes, sec.; T. E. Smith, London, sec.; Bewick, Moreing & Co., cons. engr. and gen. mgr.; John Adam, mine supt.

Registered in Victoria April 24, 1912, as a second reconstruction of the Great Fitzroy Gold & Copper Mines, Ltd., registered May 3, 1907, first reconstructed July, 1908. See Vol. X.

Capitalization £225,000, shares 5s. par; issued 450,000, credited 2s. paid; June 6, only 6d. remained unpaid. Shareholders were offered 1 new share credited 2s. paid for every old £1 fully paid share, up to May 31, 1914. Debentures, £100,000 first mortgage 6% bonds, redeemable on or before April 24, 1915; £42,950 redeemed June, 1913. For fiscal year ending June 30, 1909, net profit was £12,187, of which £11,687 was written off for construction and development, and for fiscal year ending 1910, net loss was £19,753. In year ending April 30, 1913, company's accounts show £184,137 received from metals sold and expenses £169,440, or a net profit of £14,697.

Property the Mt. Chalmers mine with 273 acres, leasehold, about 10 miles northeast of Rockhampton, also the Tungamull estate of 5,050 acres, freehold, 3 miles from the mine, bought for water supply. The mineral property shows a cupriferous formation up to 300' in width, carrying large lenses of ore in sedimentary rocks with intrusive dikes of dolorite. Ore contains auriferous and argentiferous pyrite and chalcopyrite, together with free gold, in a quartzose gangue. Overlying the silicious orebody is a lens of sulphide ore consisting chiefly of mixed sulphides of iron and copper, with barite. The orebody on the 150' level has a maximum width of 120' and known length of 330'.

Development is by three 3-compartment shafts, known as the East shaft, which is at the old workings; the West shaft, which is at the new workings, and "A" shaft, all shallow, 2 being of 225' and 240' depth. Ore reserves were conservatively estimated, March, 1912, at 600,000 tons, averaging 3% copper and 2.51 dwts. gold per ton.

Reserves include 31,611 tons pyrite ore averaging 2.16% copper and \$1.96 in gold, and 475,435 tons silicious ore averaging 2.75% copper and \$2.36 gold, a total of 507,046 tons. Pending a solution of cheap treatment problem, development work was restricted and no attempt made to prove the limits of the orebodies.

Equipment includes a steam plant, with hoists and 8-drill and 20-drill

air compressors. An aerial tram connects the smelter with a railway. A dam has been built at Tungamull with a pipe line to the works.

The concentrating plant, comprising Cornish rolls, grinding pans, jigs, vanners and Minerals Separation Flotation plant, is running continuously and very satisfactorily. In year ending May 31, 1913, the mill produced 14,445 tons concentrate assaying 10.96% copper and \$8.29 gold per ton, all sent to the smelter. The extraction was 84% of the copper and 78% of the gold.

The smelter, formerly having a 100-ton water-jacket blast furnace making matte, was rebuilt and now has two 200-ton water-jacket blast furnaces, converter plant and a sintering plant, to operate under the Dwight-Lloyd patents.

Production for fiscal year ending June 30, was 2,194,293 lbs. fine copper, 32,499 oz. silver and 5,990 oz. gold in 1909; 2,843,246 lbs. copper, 35,204 oz. silver and 6,482 oz. gold in 1910. The production for the fiscal year 1910 was secured at a cost said to have been 32s. 8d. per long ton of ore, with 53,416 tons treated, giving a total cost of about £85,000, against which are to be set about £3,500 for silver production and £26,000 for gold production, leaving a cost of at least £55,000 against 1,287.15 long tons of copper, giving a cost of approximately £42 15s. per long ton for copper, at the mine, in the form of matte, requiring conversion, electrolytic refining, freight and marketing costs, aggregating several cents per pound.

For the 13 months ending May 31, 1913, the works treated 107,098 tons of ore, of which amount 34,887 tons, assaying 2.88% copper and 2.83 dwts. gold per ton were sent direct to the smelter and 71,847 tons concentrated, making 2,050 tons blister copper, containing 2,034.8 tons copper, 1,029.5 oz. gold and 30,475 oz. silver.

The mineral flotation mill is now making a profit of £2,000 a month. Management is experienced and capable. It looks as if a favorable turn had been made in the fortunes of this hitherto unfortunate enterprise.

The company took an option on the Laloki copper mine in Papua, during the past year and spent £2,960 on the property. The mine is 17 miles from Port Moresby and the Government is expected to build a railway to Sapphire creek, 2 miles from the mine. The ore is a basic sulphide carrying 3 to 4% copper and 2 oz. gold per ton. Development is by a 140' shaft with level at 74' with 74' crosscut to lode and 88' drifting on the vein. The property is a promising source of much needed porphyritic ore for the Great Fitzroy Mines, Ltd.

GREAT HERMIDALE SOUTH COPPER CO.

NEW SO. WALES

Idle. Mine at Hermidale, Canbelego Co., N. S. W., Australia. Absorbed, Jan., 1908, the Great Hermidale Copper Co. Has a 370' main shaft.

GREAT LAXEY, LTD.

ENGLAND

Secretary and registered office: J. Crossley, 55 Cross St., Manchester, England. Local secretary and office: T. Garland, Laxey, Isle of Man, England. F. J. Robertshaw, chairman; E. McGee, vice-chairman; preceding officers, T. Stuttard, J. P., W. B. Knapman and Thos. Settle, directors; Capt. John Roberts, mgr. Organized March 3, 1903, under laws of Great Britain, as a reconstruction of Great Laxey Mining Co., Ltd., capitalization £30,000, shares 10s. par, in 45,000 priority and 15,000 ordinary shares, fully issued and fully paid. The old company paid dividends to 1899, aggregating £36 15s. on each £4 share. Present company has paid dividends aggregating 60% on priority shares and 5% on ordinary shares.

Lands, 1,103 acres, held under 31-year leases, expiring Oct., 1933, at a royalty of 2½%. Lands carry lead, zinc and copper sulphides.

GREAT NORTHERN COPPER SM. CO.**NEW SOUTH WALES**

Idle. Works office: Newcastle, Northumberland Co., N. S. W., Australia. Property is a small smelter, turning out blister copper of about 98.5% average tenor, carrying some gold and silver.

GREAT ZEEHAN DUNDAS SILVER LEAD**MINING CO., N. L.****TASMANIA**

Mine office: Zeehan, Tasmania, Australia. The company owns a group of claims aggregating 33 acres, near the town of Zeehan, on the west coast of Tasmania. Though called a silver-lead mining company, its property has 3 veins, showing copper, which extend into the holdings of another company where they are now being prospected. A lode, previously unknown, was opened in 1913 by a tunnel driven to crosscut the 3 veins already worked. This new vein is 4' wide with 1' paystreak carrying 7% copper, 50 oz. silver per ton and 63% lead. The southwest portion of the property shows an ironstone outcrop 20' wide carrying tin.

GRÖNLANDSK MINEDRIFTS AKTIESELSKAB**GREENLAND**

Office: Raadhuspladsen 37, Copenhagen, Denmark. Mine office: Allan-gorssuak, South Greenland. E. Glückstadt, chairman; M. Ib. Nyeboe, managing director; preceding officers, Chr. Hasselbalch, G. Halkier and H. P. Prior, directors; E. Höeg, smelter supt. Organized May 31, 1907, under laws of Denmark, capitalization 1,000,000 kroner, in shares of 500 kroner and 1,000 kroner par.

Property is situated on the outmost cape of a peninsula, not far from the Cryolite mines at Ivigtut. The mine known as the Josva, or Allan-gorssuak shows bornite and chalcopryite ore, with some malachite near the surface, occurring in a 1¼' vein, or mineralized fault fissure in metamorphic schist and also as an interbedded lenticular mass of copper-bearing schist. The vein runs N. E., dips at 70° and is proven to a depth of 400'. The ores are estimated to average 6% copper, with traces of precious metals.

Development includes 2 shafts, each 400' deep and a 70' prospect shaft. Equipment includes 200 h. p. plant with 2 hoists good for a depth of 450', 4 Ingersoll air compressors and 24 buildings. There is also a 36" water jacket Fraser & Chalmers furnace, making 20% matte and using coke costing \$7.50 per ton.

GUACIMO; MINA.**PANAMA**

Probably closed down. Mine at Las Minas, Los Santos, Panama. Mine, formerly held by the Boston-Panama Mining Co., has a 70' shaft, with a crosscut to the east showing several veins, reported to carry cuprite and chalcopryite, and a west crosscut showing veins of 30" and 7' width, both carrying chalcopryite. Mine is wet.

GUAYACAN SMELTER.**CHILE**

Owned by Sociedad Chilena de Fundiciones.

GUERNICA SILVER & COPPER MINES**(BOLIVIA), LTD.****BOLIVIA**

Office: 28 Victoria St., London, S. W., England. Mine office: Uyuni, Potosi, Bolivia. Nicol Brown, chairman; T. Huntington, C. D. Rotch, P. Coventry Tarbutt and H. de Winton, directors; F. C. Potter, sec. Organized Dec. 31, 1908, under laws of Great Britain, capitalization £110,000, shares £1 par; issued £100,007, fully paid.

Property 117 hectares (289 acres) situated in Sur Chicas province, 80 miles south of Uyuni, the nearest point on the Antofagasta railway, bought for £5,000 cash and £57,500 in fully paid shares, with a deferred payment of £10,000, payable out of the first profits. Claims carry 6 veins with 5% copper ore rich in silver. Owners are installing a concentrator. Company needs funds as property requires about \$100,000 to bring it to a profit.

able stage. The company tried traction engines which would not work on the very steep mountainous roads.

GUIDE MINING CO.

TRANSVAAL

Lord Islington, chairman, 4 Broad St., London, E. C., England. Mine office: Palabora, Zoutpansburg, Transvaal, S. A. Company has extensive holdings about 4 miles north of Lulu Kop near Palabora, 50 miles east of Leysdorp, which show many native workings on disseminated ores in pyroxenite. The Government geological report says the ore occurs as chalcopryrite and bornite in seams, patches and disseminations, in a pink orthoclase pegmatite that cuts pyroxenite. The latter rock is a local smeary differentiation product of the prevailing granite of the region. The property is now idle, and in a caretaker's hands as the 120' shaft failed to show any vein and the low grade of the ore did not warrant further work in so remote a place.

GUILLERMO CARVALLO.

CHILE

See Carvallo; Guillermo.

GUILLERMO GRUNDY.

PERU

Mine at Musquituni, Lampa, Puno, Peru. Lands, 6 hectares, known as the Limón Verde and Berenguella mines, both carrying argentiferous copper ores. Smelter, known as the Fundición de Las Maravillas, has a daily capacity of about 40 metric tons.

GULF CREEK COPPER MINE.

NEW SOUTH WALES

Office: 18 Fenchurch St., London, E. C., England. Mine office: Gulf Creek, Murchison Co., N. S. W., Australia. London Metal Banking Co., owner. Robt. Schloesser, gen. mgr. Land, 248 acres, known originally as the Cornish, and latterly as the Gulf Creek mine, 22 miles from Barraba, the nearest rail point, held under a 20-year lease. The property shows schist and quartzite, of early Silurian age, altered through basic intrusions and indurated clay-slate of Carboniferous age, with dikes of serpentine. There are 4 parallel veins, of 10 to 40' estimated average width, traceable 300'. The upper workings of the mine carried melaconite, azurite and malachite, but these have been exhausted, and the ore at depth is slightly auriferous and argentiferous chalcopryrite, in a gangue of about 50% pyrite, 15% silica, 7% alumina and 5% lime. The Big vein was on fire, from spontaneous combustion, but burned out, 1905, and as a result yielded 500 tons of natural matte, of 12 to 20% copper tenor, from ore averaging about 3% copper. The mine has 15 small shafts and a main shaft 470' deep, 1911, with about 4,280' of workings, estimated to show about 150,000 long tons of ore blocked out for stoping, or about 3% copper tenor.

Equipment includes a 150-h. p. steam plant, with a 20-h. p. hoist good for 500', and an air compressor.

The smelter, connected with the mine by a half-mile ground tram, built 1896, has two 15-ton reverberatory furnaces turning out matte of about 35% copper tenor, and a small cementation plant.

GUMESHEVSK MINE.

RUSSIA

Owned by Sissert Co., Ltd., and described under that title.

GURINSKY MINE.

RUSSIA

Is a group of copper mines in the Bogoslov district and in the Ural mountains, 8 miles from Bogoslovsk. The ores occur in deposits like a lode and average 5% copper, according to recent reports.

HAFOD COPPER WORKS.

ENGLAND

Owned by Vivian & Sons and described under that title.

HAMLEY MINING CO.

SOUTH AUSTRALIA

Office: Grenfell St., Adelaide, South Australia. Mine office: Wallaroo, South Australia. John S. Scott, sec.; Wm. Holland, mgr., at last accounts.

Under various ownerships the mine has paid dividends of £58,899, and to end of 1912 the company had received subsidies of £2,000, from the South Australian government.

Lands, 581 acres, Crown lease, adjacent to the Moonta mine, show 6 fissure veins in porphyry varying 1 to 6' in average width, with occasional widths of 10 to 15'. The veins are practically parallel with strike of north 20° east and westerly dip. Mine opened 1861 and worked almost continuously since, is on the Karkarilla vein, 6 to 12' wide, in porphyry. The vein consists of quartz and feldspar with seams and stringers of bornite and chalcopyrite, the ore as a whole averaging about 3½% copper.

Development is extensive, there being 2 main inclined working shafts, one 1,050' deep with levels at every 10 fathoms and long drifts on the vein, aggregating several miles. Most of the ore extracted in 1912 was from the 200', 300' and 360' levels.

Equipment includes a steam plant, with 3 hoists, including a new hoist installed 1909 at No. 2 shaft, and an air compressor. The mill, a quarter-mile from the main shaft, and connected by a surface tram, is of about 50 tons daily capacity. Its equipment is antiquated, consisting of a crusher, Cornish rolls, 1 jig and 3 buddles, but the mill is doing good work notwithstanding. Ore is dressed to 18 or 20% copper tenor and concentration is about 11 into 1. The smelter contains 3 blast furnaces which were in operation in 1912.

Production, 1903-06, was 17,756 long tons of ore, yielding 3,636 tons of concentrates of about 16% average copper tenor. Produces an average of 15 tons daily. During first half of 1912, produced 1,400 tons blister copper, or 379,600 lbs., and the year's production was about 700,000 lbs. It seems probable that with adequate capital and further development the mine might be made payable.

HAMPDEN CLONCURRY COPPER MINES, LTD. QUEENSLAND

Address: Edwin Habben, secretary, 360-366 Collins St., Melbourne, Australia. English office: Palmerston House, London, E. C., England. Mine office: Cloncurry, Beaconsfield Co., Queensland, Australia. J. L. Wharton, chairman; Hon. Wm. Laurence Baillieu, vice-chairman; H. H. Schlapp, Wm. Orr, H. F. C. Keats and Harvey Patterson, Australian directors; Wm. Douglas Reid and Godfrøy W. W. Mackinnon, London directors; Edw. Herbert Schackell, Queensland, sec.; Erle Huntley, gen. mgr.; T. Warrick, supt. Hampden mine; J. O'Connell, supt. Duchess mine; D. Wentworth, metallurgist.

Organized March, 1906, under laws of Victoria, as successor of Hampden Copper Mines, N. L., capitalization £200,000, increased Feb., 1907, to £300,000, shares £1 par, and reorganized July 31, 1909, under laws of Victoria, capitalization £300,000, shares £1 par; issued, £250,000; fully paid. The plan of reconstruction, 1909, increased the capitalization to £400,000 in April, 1912, shareholders receiving 1 new share credited as 15s. paid for every old, fully paid £1 share. Bonds £60,000, 6½% debentures, issued in June, 1913, after a similar issue had been redeemed a few months previous. A 2s. dividend was declared payable Sept. 6, 1913, compared with 4s. previously paid. Shares are listed on the London, Melbourne, Sydney, Adelaide and Brisbane stock exchanges.

This company, formed by the Ballieu group in Melbourne for the purchase of the Hampden and Duchess mines in the Cloncurry district, Queensland, also owns the Mascotte, Hampden Central, Hampden Queen, Havoë, John Egan, Imperial, Jubilee and Scalper properties, and recently bought the Trekelano mine. In 1913, the MacGregor and Salmon mines were bought from the MacGregor-Cloncurry Copper Mines, Ltd., for £108,-

500, largely because the ores are a desirable smelting mixture. The Answer and Gilded Rose mines are held under option.

The Hampden mine shows a strong lode developed for nearly a half mile that has 3 known orebodies in kaolinized slate and quartzite of Silurian age. The north orebody is the only one mined at present and worked by a 443' shaft (No. 2). The ore consists of chalcopyrite and bornite in bunches and veinlets constituting a stockwerk. The average value of the ore now mined is 7.9%. Ore production is almost entirely from No. 2 shaft, situated at the north end of property, with extensive workings in 100', 200', 234', 275', 290' and 300' levels. The ore reserves, Sept. 12, 1912, are given as 88,000 tons, containing 6,600 tons of copper. Nos. 1 and 3 shafts are also on the lode which dips steeply to the west. Development for half-year 1912 amounted to 360'. Production for year ending Aug. 31, 1912, was 8,900 tons of 9.9% ore and 2,635 tons of 7.9% ore, and for one-half year ending March 31, 1913, 9,510 tons of 8.5% ore.

The Duchess mine is about 40 miles west of Hampden at Mairindi (Duchess P. O.). Claims have a well-defined fissure vein containing high-grade bornite ore carrying a little chalcopyrite. The working shaft is 601' deep and has levels down to 550'. The 550' level, developed northward, now 549' long, shows 5' of high-grade ore that averages 17.1% copper. A winze sunk 120' below this level shows bornite ore averaging 21% for 70', the whole winze averaging 20% copper. Reserves Sept., 1912, are given as 80,000 tons of 20% ore and 56,000 tons of 5.6% ore, a total of 38,278,000 lbs. copper gross.

For the 6 months ending March 31, 1913, mine yielded 12,121 tons of 17% ore, a total for the year of 16,989 tons, averaging 17.3% copper. Mine is said to show a second vein, also in syenite, and there are a number of lesser shafts which are not operated.

The Trekelano mine is located 9 miles south of the Duchess and contains a strong vein carrying high-grade ore in schist, ore containing 8 to 25% copper. In May, 1912, the shaft, 121' deep, was being sunk in quartzite and hornblende schist. The 80' level shows an orebody 400' long averaging 8% copper. Ore reserves, Sept. 12, 1912, were 12,000 tons containing 1,680 tons copper.

The Mt. Mascotte mine, 14 miles north of the Duchess, has developed a vein averaging 20" wide to a depth of 169' with an assay value of 14.8% copper. Reserves are estimated at 2,500 tons, containing 400 tons copper.

The Salmon mine is worked for its fluxing ore and has 20,000 tons of 1% ore developed.

The MacGregor mines, purchased from the MacGregor-Cloncurry Mines, Ltd., show strong quartz veins in schist with orebodies 7 to 10' wide, averaging 8% copper. In 1912, the mine yielded 2,300 tons of 6% ore and the ore reserves were estimated at 87,200 tons of 8% ore with 50,000 tons of 4% ore. The shaft is 250' deep with a south level 322' long, all in ore. May, 1913, new owners started work on the Wallaroo mine, the 11' level being extended 90' through 1% ore and the south drift 93' through quartz pyrite carrying one-half per cent copper.

The Answer is a new mine near Selwyn P. O., 13 miles southwest of Mt. Elliott. Opened in 1912 by 2 shafts sunk to water level, showing high-grade bornite and glance ore.

The Gilded Rose held under option, 1912, employed 6 men developing gold and copper ore.

The Hampden Queen and Hampden Central mines at Friezland were developing in 1912. The Havoc, Imperial and Jubilee mines at Springs P.

O. and the John Egan mine, at Heightsville, were developing in a small way in 1912.

The smelting plant is located at Hampden and was blown in July, 1912. It contains 2 furnaces, one 42x84", the other 42x168", connected with a steel stack 8' in diameter and 170' high. The Hampden ore, which is a heavy pyritic material, is screened and the fines, mixed with the materials from the other mines, is sintered in a Dwight-Lloyd machine before charging. The 55% matte is converted in shells, 7½x10½'. A labor strike caused a shut-down throughout June, 1913.

The central power station has 3 gas producers of 500 h. p., 3 gas engines of 320-h. p. and 2 of 200-h. p., run tandem.

Production for the half year ending March 31, 1913, was 3,538 tons of fine copper, 1,687 oz. gold and 38,144 oz. silver produced from 24,874 tons of ore and 2,125 tons of old matte. Of the total ore treated 9,510 tons of 8½% ore came from the Hampden mine and 12,121 tons of 17% ore from the Duchess mine. Production in May, 1913, was 1,570,240 lbs. copper from 6,600 tons of ore.

The property has been developed under many disadvantages, with discouraging delays and an expense much greater than anticipated, but the work seems to have been well done, the new smelter working satisfactorily, the mines promising and the company's prospects for continued dividends improved.

HAMPDEN CONSOLS MINE.

QUEENSLAND

Owned by Mt. Elliott Co., Ltd., and described under that title.

HAMPDEN SOUTH CONSOLS MINE.

QUEENSLAND

Owned by Mt. Elliott Co., Ltd., and described under that title.

HANAOKA MINE.

JAPAN

Address: Kumakichi Ishida, owner, Hanaoka, Kita-Akita, Ugo, Japan. This is a mine in northern Japan opened 1907, developed for several years past, producing about 250,000 lbs. copper in 1908, but reaching the million mark for the first time last year. Production was 22,996 lbs. fine copper in 1911 and 1,895,008 lbs. in 1912.

HANSEATIC MINING CO.

GERMAN S. W. AFRICA

Company did considerable prospecting in the Rehoboth territory in 1912, but found no payable ore deposits and has abandoned the field.

HARNECKER; OTTO.

CHILE

Office, mine and works: Ligua, Aconcagua, Chile. Organized 1883. Property consists of 5 mines and a small smelter called Peña-Blanca. Otto Harnecker, sole owner.

El Carmen mine has orebodies in blanket deposits, or beds, in fossiliferous limestone. The beds carry chalcoppyrite, with oxidized copper ores, over a wide extent of territory and extending for 6 kilometers (3.6 miles) along their strike. There are 5 to 8 of these bedded deposits recognizable, the main bed averaging 3' in thickness, dipping 31° and showing oxidized ores for 20 meters, succeeded by sulphide ores. The lode is opened by an 80-meter crosscut tunnel, with about 250 meters of laterals, all in ore averaging about 4.5% copper. Mine has about 25,000 tons of ore developed and is considered promising.

The Mina Maquis, 4 kilometers from the smelter, has 8 parallel veins in porphyry, reported by the owner to be traceable about 15 kilometers, with strike of north 18° east and dip of 43°, with widths of 5 to 12'. The ore below 30 to 50 meters in depth carries chalcoppyrite with granitic gangue, averaging 5% copper, ore being especially suitable for fluxing the silicious ores of the other mines of the district. Mine has reserves of about 20,000 tons of ore.

Las Luías mine, on the same veins as Los Maquis, but 3 kilometers north, has chalcopryite averaging about 3.5% copper, with 15,000 metric tons of ore developed. San Pedro mine, carrying ore about 6% average copper tenor, has reserves of about 10,000 metric tons. Mr. Harnecker also owns several other promising claims, including the Colique and Santa Ana.

The smelter, known as the Fundición de Peña Blanca, 5 kilometers from the station of Ynjenio, has a 30-ton cylindrical water-jacket blast furnace, using Westphalian coke making matte of 48 to 55% copper tenor, from ores averaging 5 to 5.5% copper. The smelter gives very clean slags, assaying down to 0.2% copper, and does a custom business that is a blessing to the small operators of low-grade mines in the vicinity of La Ligua and Cabildo. The smelter handled 3,024,940 kgs. of 6% ore in 1912, producing 36,270 kgs. of 50.2% copper matte, at a cost of \$63 (Chilean currency), or 66 cts. per lb.

Recent production has been as follows: 311,972 lbs. fine copper in 1903; 342,043 lbs. in 1904; 354,646 lbs. in 1905; 190,455 lbs. in 1906; 126,764 lbs. in 1907; 156,625 lbs. in 1908; 221,280 lbs. in 1909; 150,000 lbs. in 1910; 186,500 lbs. in 1911, and 400,000 lbs. in 1912. The matte, or regulus, is shipped to the Société des Mines de Cuivre de Catémou.

Mine about 100 yards from the great Longitudinal railroad of Chile. The owner is gradually acquiring new properties and has proven a thoroughly capable manager. The mines and smelters are operated on a modest scale, but along sound lines.

HARPURS HILL MINE.

QUEENSLAND

Near Mt. Perry, Queensland, Australia. Originally owned by Harpurs Hill Co. and later by Normanby Syndicate, Ltd., F. M. Kirby, liquidator. Now held under lease. Present operators have sunk new shaft and opened up high-grade copper ore from which small shipments were made in 1913. Veins are too small and the development insufficient to supply the concentrator erected by the Normanby Syndicate with ore. Is a leasing, not a mining proposition.

HATASA MINE.

JAPAN

See Ono Mining Co.

HAUT-KATANGA; UNION MINIERE DE.

BELGIAN CONGO

See Union Minière de Haut-Katanga.

HEIHACHI TANAKA.

JAPAN

Owns the Kunitomi mine, Hokkaido, Japan, which produces gold and silver-bearing copper ores. The mine employs 360 hands and has a 174-h. p. plant. Production was 1,583,911 lbs. copper with \$22,005 in gold and \$28,362 in silver in 1911 and 1,924,688 lbs. fine copper in 1912.

HELSINGBORG'S KOPPARVAERK AKTIEBOLAGET. SWEDEN

Office: Helsingborg, Malmöhus, Sweden. Works at Raus Plantering, near Helsingborg. Lord Lieut. G. Tornerhjelm, pres.; Hon. Albert Berg von Linde, vice-pres.; Consul C. Ingelsson, managing director; Consul Ivar P:son Henning, Prof. Carl Sjunnesson, secondary officers; G. A. Thulin, asst. managing director; Vice Consul G. Lindegren, Arthur Ramén, chief engr.; Axel Sundberg, smelter engr.; Sten G. Lilja, chemist; Ernest E. Brand, supt. briquetting plant; R. Franzen, assayer.

Organized 1900, under laws of Sweden, capitalization 500,000 kroner, increased, 1903, to 1,000,000 kroner, again increased, 1906, to 1,500,000 kroner. Shares 1,000 kroner par. Net earnings, 1912, were 873,339 kroner. Dividends 30% in 1911, 30% 1912. Annual meeting in May.

Company was originally formed to treat cinder from pyrite burners by chloridizing, roasting and leaching in order to extract copper from the

residue of the Skanska Superfosfat and Svafvelsyrefabriken. This proving profitable the present company was organized to build a large plant to handle the Sulitelma cinder from the sulphuric acid works. Company receives the cinder by boats from the different wood-pulp and acid works of Norway and Sweden at Rää, where grab buckets unload it into cars on the electric railway, 2 miles from the works.

Property consists of 25 acres containing power station, crushing plant, etc. The finely-ground material is treated in 7 mechanical furnaces handling 45 tons each per day. These Ramón-Beskow furnaces are used in most wet copper works throughout Europe. Smelting department includes 3 gas-fired regenerative reverberatory furnaces handling 15 tons copper precipitate each 24 hours.

The leaching department includes 35 tanks holding 30 tons for leaching roasted ore. The solution passes into 17 tanks with mechanical stirrers in which the copper precipitate is obtained. This precipitate is briquetted in hydraulic machines. The silver-bearing precipitate will in the future be sold to electrolytic refineries, but has been treated by Claudets process in the past. The residue, or blue-billy, is briquetted by channel furnace process, using 3 furnaces of Ramón channel type handling 75 tons per day. No binding material is used.

The burnt ore received by the company averages 3.6% copper, 2% zinc, 4½% sulphur and 1 oz. silver per ton. After treatment the residue contains 0.07% copper, 0.15% sulphur, 0.1% zinc and 61% iron.

The copper is run into ingots marked HAK with 99.8% copper, B 99.75%, C 99.7% and G 99.5% copper, the first two brands being used for brass and copper sheets, the third for alloys of high quality and the last for casting purposes.

In 1912 the works treated 83,786 long tons yielding 4,432 tons of cement copper, 63,387 tons of iron cinder, 1,559 lbs. of silver, the total product being 8,691,361 lbs. of refined copper, including 1,149 tons of bessemer copper from the Sulitelma mine, treated in the refinery.

HENDERSON & CO., LTD., WM.

SCOTLAND

Works office: Irvine, Ayrshire, Scotland. Property is a plant for leaching copper values from cinders remaining from the burning of cupriferous pyrites.

HENDERSON'S TRANSVAAL ESTATES.

TRANSVAAL

Idle. Mine at Berkenrode, Zoutpansberg, Transvaal. Property is in the vicinity of the Messina mine. Development on the copper deposit was begun about July, 1909, and suspended 1912.

H. E. PROPRIETARY, LTD.

TRANSVAAL

Secretary and offices: W. Smith, 10-11 Austin Friars, London, E. C., England. Local sec. and office: H. Williams, City House, Harrison St., Johannesburg, Transvaal, S. A. F. H. Hamilton, chairman; L. Ehrlich, A. L. Secretan, Capt. F. B. Lawson, directors. Local committee, J. H. Rainier, J. A. Cohen, Johannesburg. E. T. McCarthy, cons. engr. Company registered Aug. 19, 1901, capitalization £150,000, shares £1 par; 130,200 issued and fully paid.

Company owns 357 claims and has options on other properties, including a copper property, in the eastern portion of the Murchison range, Transvaal.

HERBERT-IRVINE COPPER MINES, LTD.

ENGLAND

Secretary and offices: G. Baker, 48 Dover St., Piccadilly, London, W., England. S. Irvine, D. Herbert, G. Baker and W. H. Brown, directors. Organized May 23, 1912, capitalization £5,000, shares 3,000 preferred at £1

par, 40,000 ordinary at 1 s. par; 1,700 preferred issued and 36,200 ordinary issued and fully paid.

Company has lease of mining rights on Fair island, 1 of the Shetland Island group, for 24 years, on royalty of 10% of net value.

HERKULES FRISCHGLÜCK-STOLLN UND KIESELS

HOFFNUNG-ERBSTOLLN.

GERMANY

Office and mine: Johanngeorgenstadt, Saxony, Germany. E. R. Poller, manager, at last accounts. Mine, in the vicinity of Schwarzenberg, carries sphalerite and chalcopryrite, and is a small producer, mainly of zinc blende.

HERRERIAS; MINA LAS.

SPAIN

Owned by Bede Metal & Chemical Co., Ltd., at Puebla de Guzman, Huelva, Spain.

HIBIRA MINE.

JAPAN

Mine office: Kitakata, Higashi-Usuki, Hyuga, Japan. Seikyo Naito, owner. Mine is an old property, located on the eastern bank of the Tsun-ansegawa, a branch of the Gokasegawa, which gives deep water transportation. The mine produces pyrite, with some chalcopryrite averaging 5 to 6% in copper tenor, in thin 5-20' lenses in clay-slate and sandstone. Equipment includes power installations aggregating 810-h. p. Production was 1,930,734 lbs. fine copper in 1908, 1,800,963 in 1911, and 1,932,368 lbs. in 1912.

HICKEY & BROWNE.

TRANSVAAL

Office and mine: Motale, Zoutpansberg, Transvaal. G. Hickey and E. G. Browne, owners. Lands, 1,200 claims, 2,000 acres, held under license from the government, on the Motale and Lumbuvi rivers, in the Pietersburg district. Property shows fissure veins in diabase, and contact deposits between diabase and quartzite, both with a generally east-west strike, and nearly vertical dip, there being 10 known orebodies, of which 5 are under development. Veins are of 2 to 30' width, and traceable for 2 miles, carrying some native copper, malachite, azurite and bornite, but mainly chalcocite, giving assay values up to 70% copper, 20 oz. silver and up to 3 dwts. gold per long ton. Mine has pits and shafts of 20 to 118' depth with about 350' of laterals giving a promising showing of high-grade ore.

Owners are shipping 5 tons glance monthly, averaging about 40%.

HIGUERA; FUNDICIÓN DE LA.

CHILE

Owned by Felix Vicuña, at Higuera, Coquimbo, Chile.

HILDA MINE.

CHILE

Mine office: Higuera, La Serena, Coquimbo, Chile. Richard H. Everitt and Juan Bode, owners and managers, at last accounts. Lands, 2 perteneccias, 10 hectares, 12 miles north of Higuera, carrying 3 parallel veins in diorite and granite. Main vein about 30' wide at surface, shows chrysocolla and carbonate ores of good tenor, opened by shafts of 20' and 50'. Ore produced averages 15% copper, after cobbing, and is sold to the Sociedad Minera San Juan.

HIMMELFAHRT FUNDGRUBE.

GERMANY

Office: care Kgl. Sächs Staatsfiskus, Dresden, Germany. Mine near Freiberg, Saxony, Germany, is owned and operated by the Saxon Crown, employing about 1,100 men. Production is about 12,000 metric tons of ore yearly, mainly silver-lead, including about 2,000 metric tons of highly argentiferous chalcopryrite and arsenopryrite.

HIRAGANE MINE.

JAPAN

Mine office: Funatsu, Yoshiki, Hida, Japan. Takaoki Yokoyama, owner; S. Tsubouchi, supt., at last report. Mine carries silver-copper ore and has steam and electric plants aggregating 460-h. p. Production was 960,351 lbs. fine copper in 1906; 1,392,280 in 1907; 1,023,386 in 1911 and 1,083,180 lbs. copper in 1912.

HISANCHI MINE.**JAPAN**

Owned by Mitsu Bishi Co.

HISANOSUKI ISHIHARA.**JAPAN**

Owns the Akagane mine, Hyogo, Japan, having a small power plant and producing 93,042 lbs. copper with \$2,776 worth of silver, by a force of 85 men, in 1911 and 152,874 lbs. fine copper in 1912.

HITACHI MINE.**JAPAN**

Owned by Fusanosuke Kuhara, manager. Mine office: Hitachi Ibaraki Tokio, Japan. Property is a new mine of much promise carrying ore averaging about 4.5% copper tenor, and finished copper is said to cost between 9 and 10 cts. per lb. laid down. Equipment includes power installations aggregating 3,420-h. p. Forces average 1,013 hands. Production was 577,560 lbs. fine copper, 1906; 1,767,169 in 1907; 2,229,901 in 1908; 15,387,798 in 1909; 11,251,759 in 1910 and 12,409,152 lbs. fine copper in 1912.

HOFRET-EL-NAHAS MINES.**SUDAN**

Mine at Hofret-en-Nahas, Kordofan, Anglo-Egyptian Sudan. Lands, in southwestern Kordofan, are worked in a small way, to meet purely local demands, ore being smelted in primitive furnaces at the mine.

HOHIGSMUND HAMBURG; GEWERKSCHAFT.**GERMANY**

Is an iron mining company near Gosenbach, Westfalen, Germany. Albert Schneider, Wilhelm Utch, Jacob Kreutz, Friederich Haas and Josef Hermeling, executive committee. Property is an iron mine, employing about 300 men, producing annually about 35,000 tons of iron ore, and 40 tons of copper as a by-product.

HOKOISHI MINE.**JAPAN**

Idle. Mine at Kamo, Nii, Iyo, Japan. Is a lenticular deposit of chalcopryrite, associated with pyrite in folded chloritic schists, about 1' thick. Ore carries 3.5 to 4% copper. Production 1900, was 52,373 lbs. fine copper. It is a small mine and probably unworkable except when copper prices are high.

HOLMHOLMEN COPPER CO., LTD.**NORWAY**

Property sold to Ranen Copper Co., Ltd., Jan., 1913.

HOMANZAN MINE.**JAPAN**

Mine office: Adakaya, Yatsuka, Izumo, Japan. Tojiuro Hori, owner and manager, at last accounts. The mine carries copper ore without appreciable gold or silver values. Equipment includes a 356-h. p. steam installation, and forces averaged 491 hands in 1908. Production was 699,331 lbs. fine copper in 1907; 1,017,501 in 1911 and 778,306 lbs. fine copper in 1912.

HONGROISE DES CUIVRES; SOCIÉTÉ.**HUNGARY**

Office: 13 Chaussée d'Antin, Paris, France. Mine office: Zám, Hunyad-Megye, Hungary. Comte de Choulet, chairman; D. Reimbert, supt. Organized under laws of France, as successor of Société Anonyme des Cuivres de Transylvanie.

HONGROISE DES MINES; COMPAGNIE.**HUNGARY**

Office: Brussels, Belgium. Mine office: Urvölgi, Hungary. Comte C.-F. de Ferré de Peroux, chairman. Organized Feb., 1903, under laws of Belgium, capitalization 1,500,000 francs. Dividend, for fiscal year 1906, was 7 francs 50 centimes. Controls the Société de La Mine de Cuivre Urvölgi, which owns the Urvölgi mines in Hungary.

HONJYO COPPER WORKS.**JAPAN**

See Furukawa Mining Co.

HOVIN KOBBERMINER; AKTIESELSKABET.**NORWAY**

Address: Hovin, Christiansand, Norway. Property includes small copper mines at Hovin, Bodin and Gransherred. Production about 415 metric

tons of ore, averaging 12% copper tenor, giving a yearly production of approximately 100,000 lbs. fine copper.

HUACHUMACHAY; SOCIEDAD MINERA.

PERU

Mine address: Huachumachay, Yauli, Junin, Peru. Organized 1900, under laws of Peru. Property consists of a group of 10 pertenencias, including the Santo Domingo and Huachumachay mines, developed by a tunnel. The claims are traversed diagonally by the vertical Crucero and Octavio veins, giving a long ore shoot on the Veta Crucero, where the vein is $2\frac{1}{2}'$ wide and carries quartzose ore averaging about 12% copper and 2 kgs. silver per metric ton. The Veta Octavio is barren away from this intersection.

The mine has an amalgamation mill and a 40-ton smelter. Forces average 80 men at wages of about 0.8 pesos daily. Production was 133,152 lbs. fine copper in 1904; 149,030 lbs. copper and 1,066 kgs. silver in 1906; 86,420 lbs. copper and 592 kgs. silver in 1907.

HUANCHACA DE BOLIVIA; COMPANIA.

BOLIVIA

Office: 29 Rue de Londres, Paris, France. Mine office: Pulacayo, Potosi, Bolivia. E. Sénéchal de la Grange, chairman; F. Puelma, vice-chairman; Luis M. Solá, gen. mgr.; Segundo R. Nava, gen. sec.; preceding officers and H. Marijon, directors; E. Langlois, chief engr. Organized 1873, and reorganized 1891, under laws of Bolivia, capitalization increased, 1877, and again, 1891, to 12,800,000 bolivars, about \$8,000,000, shares \$25 par, fully paid. Recent dividends have been 8s. in 1895; 12s. in 1900; 6s. in 1901; 4s. in 1902; 4s. in 1903; 4s. in 1908. Accounts to Dec. 31, 1911, submitted in May, at Valparaiso, showed 61,298 bolivars carried forward; reserve fund, 1,000,000 bolivars.

Property of this company comprises several silver mines with 3,000 acres land at Pulacayo, whose ores yield copper as well as gold and silver, and are treated in company's smelting and refining plants. The veins carry complex sulphide ores with values mainly in silver, but also giving considerable amounts of lead, copper, zinc, antimony and gold, the copper production being mainly from argentiferous tetrahedrite.

The company has smelters at Pulacayo and Playa Blanca, latter, formerly leased to the American Smelting & Refining Co., now idle. In 1907, the company shipped to the Tacoma smelter 1,600 tons of ore averaging 5% copper, 5% zinc and 50 oz. silver per ton, containing 160,000 lbs. fine copper. Production estimated at 150,000 lbs. fine copper annually.

Company also owns 25 miles of railway, connecting Huanchaca with the Antofagasta (Chile) and Bolivia railway, and a 600-mile telegraph system.

HUANTAJAYA; SOC. INTERN'L MIN. i BEN. DE.

CHILE

Office: Iquique, Chile. Mine near Huantajaya, Tarapacá, Chile. Organized June 27, 1909, capitalization 300,000 pesos, shares 50 pesos par. Company inactive for several years.

HUARON; SOCIEDAD CUIVRE DE.

PERU

Owned by a French syndicate. Properties near Haiday, 35 miles from Cerro de Pasco. Company is actively developing the Travieso and other veins and has installed a 30-drill compressor. No ore will be shipped until development is further advanced.

HUECA MINE.

SPAIN

An old Roman mine, worked by Huelviana Co. and later by Dallas Pyrite Co.; won by litigation by Carlos Diaz and now under option to J. R. Catlin, 6 Norris St., London, England.

Developed by crosscut 450' long, showing great thickness of 1% copper ore with 3 veins aggregating 65' of 4% ore. Property lies in 1 of 3 conical hills of igneous rock, located as the Hueca, Guia and Ures mines. Orebody dips south (contra) into Oriente de Tharsis mine, which see.

HUELVA COPPER & SULPHIDE MINES, LTD.**SPAIN**

Office: 6 Old Jewry, London, E. C., England. French office: 17 Blvd. Haussmann, Paris, France. Mine office: Almonaster, Huelva, Spain. P. Lyttleton Gell, chairman; H. Gaillochet, vice-chairman; Chas. Forbes, sec., London; preceding officers, G. Dyckhoff, L. Donnet, H. Higgins, G. Chantlaire, J. Roux-Brahic, H. Bondonneau and Comte C. de Leusse, directors.

Organized Oct. 28, 1903, under laws of Great Britain, capitalization £400,000, increased 1907 to £600,000, but reduced again in July, 1912, to £420,000; 210,663 shares issued and fully paid. Company is a reconstruction of the Huelva Central Copper Mining Co., Ltd. Accounts for 18 months to June 30, 1912, showed a loss of £20,973, written off under the capital reorganization scheme.

For 1907, mining profit was £63,177 10s. from which was paid a 1s. dividend Oct. 25, 1907, amounting to £24,324 7s., company ending the year with a balance of £38,853 3s. Profits for 1908 were £16,439 5s. 2d., and £51,167 18s. 2d. was written off for depreciation, etc. Apparently the company should have had £2,485,999 in the hands of its French agents, Aug., 1909, but there was a great shrinkage, owing to misappropriation of funds. Shares are listed on the Paris Bourse.

Company owns the Cueva de la Mora and Monte Romero mines, comprising 246 hectares (507 acres) and other properties of 650 hectares, lying between the Rio Tinto and Tharsis properties, Huelva, Spain; also 27 hectares leased to the Tharsis Copper & Sulphur Co., Ltd., on royalty. Lands are favorably located and are traversed by the Olivargas and Juliana rivers. The company is reforesting its lands with pine and eucalyptus.

The Monte Romero is the principal mine, and the Corta, San Alberto and Angelita mines have reserves of smelting and sulphur ores, but need development. The Corta ore is low grade, but in large deposits, and the mine is estimated to contain 5,000,000 long tons of cupriferous pyrite, averaging 1.7% copper. The San Alberto mine, opened by shaft, has produced a little ore of good average grade. The Monte Romero carries ore of 1 to 5% copper tenor, but some of the ore is highly zinckiferous. Mine has a good equipment, including a haulage plant and large ore bunkers. A new pyritic smelting plant has recently been built.

The company has built a complete town for its workmen, numbering about 1,200 men, the town having a normal population of about 5,000. The company's buildings include schools and hospitals, with necessary mine structures. Transportation is by a 13-kilometer railway, connecting with the Zafra y Huelva line.

Production was 5,563 tons of cupriferous pyrite in 1905; 20,523 tons in 1906; 34,905 tons in 1907; 48,511 tons of ore and 67 tons of cement copper in 1908. Production of fine copper is estimated at 175,000 lbs. in 1905; 600,000 lbs. in 1906; 1,000,000 lbs. in 1907; 1,350,000 lbs. in 1908; 25,000 tons of 5% ore shipped and 45,000 tons sent to cementation plant in 1909. Ore reserves estimated Dec., 1909, 1,449,000 tons.

HUELVA; SOCIÉTÉ FRANÇAISE DES PYRITES DE.**SPAIN**

Office: Rue de Chateaudun 28, Paris, France. Mine office: Valdellamusa, Huelva, Spain. Albert Faraud, gen. mgr.; Victor Prévost, mgr.; Chas. Marchal, asst. mgr.; P. Truchet, metallurgist. Organized Dec., 1899, under laws of France, capitalization f3,500,000, later increased to f6,000,000, as successor of Société Française des Mines de Cuivre d'Agua Tenidas. Company owns the Confesonarios mines at Valdellamusa, the Perrunal and other mines at Cortegana, and El Lomero and Poyatos mines at El Cerro, all mined for pyrite, low in copper tenor but averaging about 48% sulphur and sold to acid works, the copper being afterwards recovered in leaching plants.

The Perrunal mine, at Cortegana, has an orebody between quartz-porphry, and argillaceous metamorphic rocks, with quartz veins following the planes of stratification.

El Lomero mine, at El Cerro, 6 kilometers east of Valdelamusa, 24 hectares, was opened 1877, and has been under development since it was taken over by this company in 1907. The property shows a gossan of 2 to 3 meters width, for about 300 meters length, and carries cupriferous pyrite, assaying about 1% copper. Development is by a 108-meter tunnel, with 3 levels opened.

Production of ore has been as follows: 13,480 metric tons in 1901; 157,821 metric tons ore and 13 tons cement copper in 1904; 154,394 tons in 1905; 194,769 tons in 1906; 239,400 tons in 1908; about 220,000 tons in 1909 and 236,000 metric tons in 1910, yielding a net profit of \$901,271. Production of copper is estimated as follows: 275,000 lbs. in 1901; 3,000,000 lbs. in 1905; 4,000,000 lbs. in 1906; 4,500,000 lbs. in 1907; 4,250,000 lbs. in 1908, and 4,750,000 lbs. in 1909. As the entire output is sold for its sulphur content and no record made of the copper which the buyers recover from the ore after it is burned for sulphuric acid manufacture, the copper production of the mine cannot be given. Mine considered valuable, with good prospects of future increase in production.

HUESO; FUNDICION EL.

CHILE

Owned by José Ramón Espinoza, at Pedegua, Petorca, Aconcagua, Chile.

HUILLCA; SOCIEDAD MINERA LA.

PERU

Mine office: Morococha, Junín, Peru. Organized 1892, under laws of Peru. Owns a group of 3 pertenencias (7 acres), including La Huillca and La Vieja mines, yielding ore averaging about 8.5% copper and 900 grams silver per metric ton. Production was 166,491 lbs. fine copper in 1904; 598,548 lbs. in 1905; 1,192,468 lbs. in 1906; 444,116 lbs. copper and 2,133 kgs. silver in 1907.

HUINAC CONSOLIDATED COPPER, LTD.

PERU

Secretary and office: W. M. Jew, 4 Lloyds Avenue, London, E. C., England. G. M. Chrussachi, W. Warren and L. Clerc, directors. Organized June 19, 1912, capitalization £400,000, shares £1 par. Company is a reorganization of the Huinac Copper Mines, Ltd.

Owns silver-copper properties covering nearly 2 sq. miles at Huaraz, Ancachs province, north of Lima, Peru; also claims aggregating 256 hectares, 30 miles from the port of Culebra, including the Montana de la Plata mine, carrying argentiferous copper ore, and extensive anthracite coal lands, 15 miles from the copper mine. A smelter, of 30 metric tons daily capacity, was blown in, 1908. Property reported on by W. Warren.

HUINAC COPPER MINES, LTD.

PERU

Wound up by court, 1911. Succeeded by Huinac Consolidated Copper Co., Ltd.

HUSA; AKTIEBOLAGET GRUFVOR.

SWEDEN

Is Swedish holding company for the Duluth-Husa Copper Mines Co.

IIMORI MINE.

JAPAN

Mine office: Ozu-mura, Naka-gori, Kii, Japan. Tanezo Nakaye, owner and manager. This is a pyrite mine whose copper production is a byproduct. The mine has only a small steam plant, most of the stoping being done by hand work and the production of iron pyrite varying greatly with the demand from year to year. The mine yielded 22,586 tons of iron pyrite in 1912, which is almost the exact production of 1907 and nearly 10 times that of 1908, while copper production has been nearly constant, being 141,338 lbs. fine copper in 1911.

IKUNO MINE.

See Mitsu Bishi Goshi-Kwaisha.

JAPAN**ILLAPEL SMELTER.**

See Geisse Hermanos, at Illapel, Coquimbo, Chile.

CHILE**ILUSION; MINA LA.****CHILE**

Idle. Mine at Talcuna, La Serena, Coquimbo, Chile. Victor Illanes, owner and manager. Property, 16 kilometers from Marquesa railway station, shows a vein of about 12' average width. Produced about 400 metric tons of ore, of about 9% average copper tenor some years ago.

INARI MINE.**JAPAN**

Mampeï Imamura, owner, Nishi-Usuki-Gori, Miyazaki, Japan. Production has been practically constant, averaging 100,000 lbs. copper a year since 1908. Output for 1911 was 106,724 lbs. copper and for 1912 was 97,416 lbs. Employs 60 persons and had 16-h. p. power plant in 1911.

INCA DE ORO i COBRE DE COPIAPÓ; COMPAÑIA MINERA**CHILE**

Office: Iquique, Chile. Mine office: Copiapó, Atacama, Chile. Organized Dec. 14, 1906, under laws of Chile, capitalization £30,000, shares £1 par. Property, apparently of promise, was a small producer at last accounts.

INCA COPPER SYNDICATE (ENGLAND).**PERU**

Liquidated, June, 1911.

INCAORO MINING CO., LTD.**PERU**

David G. Bricker, New York City, president. Mine at Yani, Peru. Property shows fissure veins in andesitic rocks carrying rich silver-copper ores. Extensive development work is now in progress and company was installing a power plant, compressor, etc., in Aug., 1913.

INCIENSO; MINA EL.**CHILE**

Mine near Sotaquí, Ovalle, Coquimbo, Chile. Lands, 300 hectares $2\frac{1}{2}$ miles from Panulcillo. The claims show a series of veins of 2 to 5 meters aggregate width, carrying sulphide ore, with gangue of limestone, iron and quartz, developed by tunnels of about 700 meters aggregate length, connected by winzes. Ore is concentrated in a mill of 150 metric tons daily capacity. Production, 1908, was 675,000 lbs. fine copper.

INIGUEZ; CARLOS VERGARA.**CHILE**

Idle. Office, mine and works: Petorca, Aconcagua, Chile. Lands include El Mauro mine, opened 1860, which has copper ore carrying considerable values in gold and silver. The smelter, known as the Fundición El Mauro, 38 kilometers from Los Vilos, the nearest port, has been idle several years. Production was 200,000 lbs. fine copper in 1903, but shrunk to 24,104 lbs. in 1906, and to 14,021 lbs. in 1907.

INNAI MINE.**JAPAN**

See Furukawa Mining Co.

INSIZWA NICKEL & COPPER DEVELOPING CO., LTD.**CAPE PROVINCE**

Office: Mount Ayliff, Cape Province. Mine office: Kokstad, Griqualand East, Cape Province. Wilfred Vernon Parsons, secretary. Organized March, 1908, under laws of Cape Province, capitalization £200,000, shares £1 par. Lands are 2 mining areas, formerly held by South Namaqua Syndicate, showing ore disseminated through norite, occasionally occurring as lenticular masses of considerable size in norite, with a shale contact. Property is a disseminated nickel deposit; the secondary enriched ores carry nickel, copper and from $\frac{1}{2}$ to $\frac{1}{4}$ dwt. platinum with 7 to 12 grains gold and $\frac{1}{2}$ oz. silver.

INTERNATIONAL COPPER CO., LTD.**ARGENTINA**

Secretary and offices: A. Dangerfield, 56 Cannon St., London, E. C.,

England. Mine office: Chilecito, Rioja, Argentina. Capt. W. B. McTaggart, D. L., J. P., chairman; H. J. Meyerstein, T. Buck, C. Lowther, M. P. and W. Parker, directors. Organized July 7, 1905, under laws of Great Britain, capitalization £100,000, shares £1 par; issued, £97,495. Was formed to finance the Famatina Development Corporation, Ltd., buying £20,000 debentures and £20,000 income bonds of that company, and agreeing to advance £60,000 additional, at 6% for the erection of a smelter, if required, securing in return the right to act as exclusive agent for sale of the Famatina Co's. copper, at 2% commission. These terms have been canceled and company's sole interest is now 323,055 fully paid shares in the Famatina Co.; 100,000 under option at 4s. per share; 50,000 at 6s. per share to Dec., 1913. Bonds issued 4,000, of £10 each, 8% interest. Interest unpaid since Nov., 1909. Accounts for 2 years to Dec. 31, 1911, show a loss to date of £95,501.

IRISH MINES PROPRIETARY CO., LTD.

IRELAND

Office: 4 Dawson St., Dublin, Ireland. Mine in Bonmahon, Waterford Co., Ireland. Organized Aug. 2, 1906, under laws of Ireland, capitalization £20,000, in 10,000 ordinary shares, £1 par, and 100,000 deferred shares, 2s. par. No returns obtained.

IRVINEBANK MINING CO., LTD.

QUEENSLAND

Office: 18 Bridge St., Sydney, N. S. W., Irvinebank, Queensland, Australia. Mine at Klondyke, via Mungana, Lynd Co., Queensland, Australia. Geo. C. Young, sec.; Dan Mackey, mine mgr. Company employs about 700 men and was engaged in copper mining on a small scale. Property includes the Linedale West Chillagoe and the Lamington copper mines, latter having a 180' shaft, with steam hoist, mine having a 12" vein averaging 20% copper and 5 to 6 dwt. gold per long ton.

Company has mined no copper ores for some years, but has produced wolfram with small amounts of bismuth, molybdenite and silver-lead ores, smelting the 4 first named in its own plant.

The smelter has a water-jacket blast furnace, planned for treatment of both copper and silver-lead ores, and also for the accumulation of tin slag.

ITALIANA; SOCIETA' METALLURGICA.

ITALY

Office: Leghorn, Italy. Selling agency: Foro Bonaparte 37, Milan, Italy. Organized 1887, under laws of Italy, capitalization increased to 10,000,000 lire and later to 17,000,000 lire. Net profits were 641,067 lire with a 7½% dividend in 1904 and profits were 1,577,816 lire with an 8% dividend in 1912. Property includes 5 plants, the largest at Leghorn, with smaller plants at Limestone, Limestone Pistoiese, Bandalone Pistoiese and Donnatz in the Val d'Aosta.

The plant at Leghorn, occupying a site of about 25 acres, includes a smelter having 4 blast furnaces, of about 70 tons aggregate daily capacity, and 4 reverberatory furnaces, casting refined copper as anodes, plates, ingots, etc. The smelter treats about 20,000 tons of ore yearly, partly native, but largely imported from Spain, America and elsewhere.

The electrolytic refinery, built 1900, in connection with the Leghorn smelter, turns out copper of very great purity.

The power plant of the works has 16 engines, with about 1,800 aggregate h. p., and a very complete electric plant, furnishing power, light and energy for the electrolytic refinery. The shops are extensive, including rolling mills, tube mills, wire-drawing shops, wire-rope shops and miscellaneous shops for the manufacture of copper into a great variety of forms. There is a special alloy foundry having 48 crucible furnaces for fusion of the principal copper alloys, the products of these works enjoying an excellent reputation. There also is an extensive plant for the manufacture of

sulphuric acid. The company turns out nearly 16,000 metric tons of manufactured copper yearly, in almost an infinite variety of forms, and employs about 2,300 men.

JAMAICA CONSOLIDATED COPPER CO.

JAMAICA

W. S. Baker, vice-pres. and mgr., room 506, No. 84 State St., Boston, Mass. Mine office: May Pen, Clarendon, Jamaica. Thomas A. Casey, pres.; Otis W. Swan, sec.-treas.; Cyril Abraham, supt. Organized Sept., 1907, under laws of Maine, capitalization \$6,000,000, shares \$1 par.

Property, 2,276 acres, 15 miles from the coast, in the Clarendon hills. The Congo Hill mine has a 455' tunnel showing a small vein carrying chalcopryite and bornite. The Copper Wood mine has a 270' tunnel showing a small stringer of bornite. The Sylvia mine has a 75' tunnel showing bornite and chalcocite, said to assay 7% copper. The Elma mine has a 240' tunnel and the Iva mine has a 90' tunnel. Company reports more than 8,000' of underground workings. Small ore shipments were made from this property, 1854-1857.

Ore contains cuprite, malachite, azurite, chrysocolla, chalcopryite, bornite and chalcocite. The central mountain range of Jamaica contains many old copper mines and most of them still show ore, but not in large enough amounts to be attractive. This company's past record is not above criticism, and has been fully discussed, Vol. X. At present no company has copper mines in the island of Jamaica having sufficient ore in sight to warrant more than the statement that they are worth developing.

JIRO SATO.

JAPAN

Owens the Uneкура mine in Iwate, Japan, employing 222 persons, equipped with 20-h. p. plant and producing 198,964 lbs. copper, valued at \$21,773 in 1911 and 208,712 lbs. in 1912.

JOSÉ BRUNO GONZALEZ JULIO.

CHILE

Idle. Mine office: Cajon de Maipó, Victoria, Santiago, Chile. Lands, known as Poderosa group, are a short distance from holdings of the Compañía Minera de Maipó, and have a parallel vein of the same general character. The copper ores carry cobalt and are different of treatment and production was small at last accounts.

JOYA MINE; LA.

SPAIN

Office: Huelva, Spain. Mine office: El Cerro, Huelva, Spain. Owned by Sucesión Vázquez López. Lands are 9 concessions, 53 hectares, near El Cerro, carrying the Levante, Poniente, Norte and San Rafael lodes. Mines were opened in ancient days by superficial workings whence the richest ores were extracted. Property shows considerable quantities of cupriferous pyrite, said to average about 48% in sulphur. The Poniente and Norte mines are opened by tunnels, on different levels. A 15-kilometer railway, to connect the mines with the Zafra y Huelva mine, was under construction, 1910, as the mine experienced great difficulties in exploitation owing to lack of adequate transportation facilities. Production was 5,000 metric tons of slightly cupriferous ore in 1908. The mine was said, 1911, to have about 300,000 metric tons of washed sulphur ore ready for export as soon as adequate transportation facilities are furnished. Property considered promising. No recent returns secured.

JUKES PROPRIETARY MINES.

TASMANIA

Idle. Mine office: Crotty, Franklin Co., Tasmania. Walter Donath, mine manager, at last accounts. Mine in the vicinity of Crotty, with a wagon-road connecting therewith, is developing by tunnel and it is planned working this property in connection with the Lake Jukes mine. There are several small mine buildings.

JULIA COPPER MINING SYNDICATE, LTD.**SPAIN**

Dissolved Sept., 1912. Formerly at Fregeneda, Spain. Described Vol. X.

JUNTA KOIDE.**JAPAN**

Owens the Mochikura mine in Niigata, which employs 206 persons, has 28-h. p. power plant and produced 473,237 lbs. copper, realizing \$53,461 in 1911 and 764,475 lbs. fine copper in 1912.

KAFUE COPPER DEVELOPMENT CO., LTD.**RHODESIA**

Secretary and office: T. Donald, Salisbury House, London, E. C., England. African agents, Bechuanaland Exploration Co., Ltd, Bulawayo, Rhodesia. Mine office: Silver King, Northern Rhodesia. Herbert L. Stokes, chairman; Thos. J. Seel and A. H. Edenborough, directors. Organized May 31, 1905, under laws of Great Britain, capitalization £350,000, shares £1 par; issued, £250,007, fully paid.

Company is controlled by Northern Copper (B. S. A.) Co., Ltd., and Rhodesia Copper Co., Ltd., all 3 having the same officers.

Company acquired from the Northern Copper (B. S. A.) Co., Ltd., a block of mining claims covering 30 sq. miles, 15 miles south of the Kafue river, and including the Silver King, Sable Antelope, Kakuya, North Star, Maurice Gifford, Crystal Jacket, Blue Jacket and True Blue mines. Also the Hippo mining property of 160 claims, and 2 farms (Hippo) comprising 6,000 acres, on the Kafue river, about 145 miles west of Rhodesia Broken Hill. The Hippo mine, though promising, is in the tsetse fly country and development has been stopped.

The principal copper deposits, so far located, are either those of old native workings or near them, occurring in a belt of limestone about 10 miles wide, that runs nearly north and south for a long distance. This limestone belt is flanked and sometimes intruded by talcose, quartzose and micaceous schists, and by granite and quartz porphyries. The copper occurs as irregular deposits in limestone and in veins traversing schists, the predominant ores being tetrahedrite and chalcocite, with occasional bornite and chalcopyrite oxidized near the surface, the ores in schists being more highly oxidized than those in limestone.

The mine has a 99' shaft showing from a depth of 34 to 99' a vein of 4' 8" estimated average width, carrying ore claimed to average 21.36% copper and 2.4 to 13 dwts. gold per long ton. There also was a second shaft of 100' which developed nothing of especial promise.

The main camp is at the Silver King mine, in latitude 14° 36' 11" south, and longitude 26° 55' east, 12 miles south of the northerly reach of the Kafue river. The main shaft of the Silver King mine is 205' deep, and the orebody, apparently a lens, pinched out before the bottom of the shaft was reached, and the developed ore is now exhausted.

At the Sable Antelope mine, the high-grade ore is also worked out and the 25-ton smelter, erected at the mine in 1911, is idle after a year's operation and the production of 1,830 tons of 72% matte. The Crystal Jacket mine and True Blue mine were worked in a small way in 1912-13, but have been idle since Feb., 1913, owing to heavy working costs, high railway rates and the royalty exacted by the British South Africa Co.

Production of the Kafue Co. for 1912 was 2,253 tons of metallic copper and matte according to the published report of the Northern Copper Co.; 1913 production amounts to 129 tons, or a total to date of 946 tons shipped, of which 605 tons were sold for £36,738. Copper matte on hand and in transit amounted to 1,307 tons, Sept., 1913.

KAFVELTORPS KOPPARVERK.**SWEDEN**

Idle. Mine address: Kopparberg, Orebro Län, Sweden. Mine has

argentiferous copper and lead sulphides, with values mainly in copper. Production was 112,590 kgs. of 72% copper matte, and 16,423 kgs. fine copper, giving net production of 214,919 lbs. fine copper in 1901, besides lead and silver contents.

KAJITANI MINE.**JAPAN**

Idle. Address: Wataro Shiraishi, owner, Oboki-mura, Niigori, Iyo, Japan. Mine has no power installation. Employed an average force of 73 persons, and produced 23,508 tons of copper ore in 1911, valued at 14,723 yen.

KALATINSKY MINE.**RUSSIA**

Located in upper Isset district. Produces cupriferous pyrite carrying 2 to 3% copper, treated in smelter erected 1912.

KALKADOON MINE.**QUEENSLAND**

Address: Arthur Powell, mine superintendent, Mt. Cuthbert, Queensland, Australia. Owned by Mount Cuthbert Co., and described under that title.

KAMAISHI MINE.**JAPAN**

Address: Chobei Tanaka, owner, Kamigo, Iwate, Rikuchu, Japan. The principal property is an iron mine, but there also is a small mine of argentiferous copper ore. Production was 56,777 lbs. fine copper and 39,733 metric tons of iron ore in 1907, increased to 1,591,635 lbs. copper with \$13,788 gold and \$13,548 silver in 1911 and 1,341,403 lbs. fine copper in 1912.

KAMBOVE COPPER MINE.**BELGIAN CONGO**

Owned by Union Minière du Haut Katanga, a subsidiary of Tanganyika Concessions, Ltd.

KAMIOKA MINE.**JAPAN**

See Mitsu Bishi Goshi Kwaisha.

KANGAIRA MINES, LTD.**NEW SOUTH WALES**

Mine office: Yass, King Co., N. S. W., Australia. Chas. Taylor, managing director. Organized 1908, under laws of New South Wales, capitalization £50,000, shares 10s. par. Report at annual meeting March, 1913, for 9 months' operations, showed £6,896 profit. Directors wrote off £2,896 for development redemption, £1,000 as depreciation on plant and declared a dividend of £461 on the 10% cumulative shares.

Lands are in the Lachlan district, about one-half mile from the Burrowa river. Management was said, 1909, to plan a 10-mile private railway to Binalong, the nearest rail station.

Mine, discovered 1899, and opened July, 1902, has a 5' vein, developed by a 284' shaft with extensive drifts on the vein. The ore is 1½ to 3' wide and contains chalcopryite, galena and sphalerite, assaying 5 to 8% copper, 5 to 30% lead, up to 3% zinc, 10 to 20 oz. silver and 5 to 12 dwts. gold per long ton.

Company has a small concentrator and ore raised is hand-sorted and the reject concentrated. Production goes to the Port Kembla works. In 1909 management shipped 210 tons of copper-lead ore, known as middlings, to London, that averaged 4.43% copper, 33% lead, 18 oz. silver and 2.5 dwts. gold per long ton. Production, 100 tons weekly, furnishing about 10 to 15 tons of first-class ore and 25 tons of concentrates. Property considered promising.

KAN-HSIEN MINE.**CHINA**

Mine office: Kan-Hsien, Kiang-Hsi, China. Is a government mine, worked under the empire by the provincial governors to supply the local mints. Development was begun 1907, a fund of 400,000 taels having been furnished for the purpose, in equal amounts by the provinces of Kiang-Hsi and Kiang-Su.

KANMANTOO COPPER MINES.**SOUTH AUSTRALIA**

Address: Kanmantoo, via Callington, South Australia. Owned by an Adelaide syndicate, formed in 1912. Received a government subsidy, 1912.

Property has 5 north-south quartz veins and 1 cross vein in schist. The Emily vein is opened by a 120' shaft (80' vertical and 40' on the dip) with a second shaft connected with it on the 65' level. An old stope 10 to 20' wide and 50' long, shows seams and bunches of chalcopryrite in schist and quartz. Samples by the government inspector, examining the property preliminary to government aid, showed 8.8% copper with \$1 to \$2 in gold and silver values. The 4 other veins show similar ore.

KANO MINING CO.**JAPAN**

Mine address: Kano-mura, Yama-gori, Iwashiro, Japan. Mine, known as the Kano, carries gold and silver-bearing copper ore. Employs 1,552 men and has steam-power equipment of 1,072-h. p. with 890-kw. electric power. Production, which was 2,000,000 lbs. in 1908, dropped to 1,633,184 lbs. fine copper in 1911, but company also produced 2,312 metric tons of zinc, a little pig lead valued at \$417 and gold and silver to the value of \$104,288.

KAPSAN CONCESSIONS, LTD.**KOREA**

Address: 418 First Nat'l Bank Bldg., Denver, Colo. Company is an offshoot of the Colbrann-Bostwick Development Co., which will be registered in London in 1914. Property consists of 4,000 square miles in N. E. Korea, in the Ham Kyeng province, and includes the Kapsan copper mine, which has been steadily developed since June, 1908, and now has reserves of 168,500 tons of 10.54% copper ore. The deposit is a mixture of chalcopryrite, pyrrhotite and a small amount of arsenopyrite, forming a hard, clean and massive ore devoid of alteration or enrichment. This ore occurs in an irregular lens, probably a replacement deposit in altered Paleozoic limestone.

KAPUNDA MINES, N. L.**SOUTH AUSTRALIA**

Mine near Kapunda, Light Co., South Australia. F. C. Howard, chairman, and David James, M. P., directors. Troubles over title are said to have been settled.

The mine, 44 miles north of Adelaide, was opened 1843, and has been worked by leasers during many years. Fully described Vol. X.

KARA BAIR MINE.**BULGARIA**

Mine, situated about 10 miles southwest of the seaport of Burgas, has several veins 1 to 6' thick, in andesite, which carry complex copper-lead-zinc ores with bornite, chalcopryrite, galena blende and pyrite in a quartzose gangue.

KARGALINSKI WORKS.**RUSSIA**

Office and works: Orenburg, Russia. W. A. Pashkoff, owner; E. O. Ternor, manager, at last accounts. Lands, 24 miles from Orenburg, include 13 different mines having 28 shallow shafts, some from prehistoric times, ore averaging about 3% copper. Equipment includes steam and gas power. Forces averaged 242 men underground and 93 on surface and production was 975,210 pounds of copper ore in 1909, estimated to have yielded about 900,000 lbs. fine copper. No recent returns secured.

KATANGA; COMPAGNIE DU.**BELGIAN CONGO**

Office: 48 Rue de Namur, Brussels, Belgium. Mine at Katanga, Belgian Congo. Baron Lambert, pres.; Col. Albert Thys, managing director; Baron Constant Goffinet, Georges de Laveleye, Alexandre Delcommune, Count John d'Oultremont, Maurice Bunau-Varilla, H. Monnom, J. de Hempinne, E. Francqui and P. Golmick, directors; A. J. Wauters, sec.; L. Goffin, and G. Périer, mgrs. Organized April 15, 1901, under laws of Belgium, as

a subsidiary of the Belgian Congo Co., capitalization f3,000,000, in f3,000,000 preferred stock, shares f500 par, and 18,000 ordinary shares without assigned value.

Lands, 160,000 sq. miles, freehold, with various preferential mining and railway concessions. Principal mining holdings comprise the Katanga, Kazemba and Pala mines, located on the upper bank of the Lualaba river, showing gold-copper ores.

This corporation is primarily a land and holding company, and its mineral properties are being developed by a number of other corporations, mainly subsidiary or collateral, these including the following companies: The Comité Spécial du Katanga, organized 1900, one-third of the capital subscribed by this company, and two-thirds by the late Congo Free State. This company is developing copper properties at Katanga, and is practically a go-between for this company and its other subsidiaries, the Compagnie du Lomami, organized 1898, which is developing mining properties on the Lomami river; the Union Minière du Haut Katanga, which is separately described in this work; the Société Anonyme de Recherches Minière du Bakat and the Société Industrielle et Minière du Katanga, which also is engaged in general exploratory work; the Compagnie Géologique et Minière des Ingénieurs et Industriels Belges, which likewise is doing general exploratory work; the Société Belge Katanga, which is prospecting for minerals and also has trade concessions; the Société Commerciale et Minière du Congo, which also is prospecting, and holds similar trading concessions; and the Anglo-Belgian Co., which holds a concession from this corporation, is engaged in trade only, and has no mining concessions.

In Feb., 1911, credit balance was 378,448 frs., the year's profit being 69,287 frs.

KAWAIAYAMA MINE.

JAPAN

Mine in Yamaguchi, Japan, has narrow veins averaging 2 to 4' in thickness traversing amphibolite schist and containing pyritic ore carrying chalcopryrite that assays about 4% copper. Production increased from 14,834 lbs. in 1900 to 86,395 lbs. copper in 1908, declining to about 55,000 lbs. valued at \$7,888 in 1911.

KAWAU MINE.

NEW ZEALAND

Located on Kawanui island, Rodney county, in Hauraki gulf, on the east coast, about 30 miles north of Auckland. Is an old mine worked in 1842 and re-opened in 1900, showing a strong quartz vein running northeast and southwest and dipping steeply, carrying chalcopryrite mixed with pyrite, mined by a shaft sunk below high water mark in the footwall of the vein.

KEDABEG MINING & REDUCTION WORKS

RUSSIA

Owned by Siemens Estate. See Siemens Copper Works.

KEF-OU-M-THEBOUL MINE.

ALGERIA

Idle. Owned by Société du Syndicat Minier.

KENNEDY MINE.

QUEENSLAND

Owned and operated by Queensland Copper Co., Australia.

KHAN KUPFERGRUBE, LTD.

GERMAN S. W. AFRICA

Address: C. Heckmann Aktien-Gesellschaft, Duisburg a. Rhein, Germany. Mine office: Arundis, German S. W. Africa. Erwin Lachmund, general manager. Organized about 1910, capitalization 1,000,000 marks, or \$239,000, of which 761,100 marks went to C. Heckman for his lease of the property from the Deutsche Kolonial Gesellschaft and 240,000 marks for promotion profits. Property embraces 10 claims of 10 hectares on which the company has not the right to extract gold or silver ores or diamonds.

Property includes the Khan copper mine, situated near Arundis, and

connected by a private railway line with the Swankopmund & Karibib railroad. Development is by 500' shaft in which the work has shown enough ore in sight to warrant the building of a 50-ton concentrator. This concentrator, now in course of construction, will be run by electric power and supplied with water from a pumping plant on the Khan river, 11 miles distant. Property has been developing for 3 years and has now reached the producing stage.

KICHIZAYEMON SUMITOMO.**JAPAN**

Described under Sumitomo Copper Co. Owns the Besshi and Nishinokawa mines.

KILLINGDAL KOBBERVAERK.**NORWAY**

Operated under lease by Bede Metal & Chemical Co.

KIRKEBY KOBBERGRUBER.**NORWAY**

Presumably idle. Office: Carl Johansgade 23-IV, Christiania, Norway. Mine at Hakedal, Christiania, Norway. Olaf Sandaas, mgr.; F. R. Bentzen, supt., at last accounts. Property about 10 kilometers from Hakedal, shows numerous parallel veins, with cross-fissures, carrying a sulphide complex of chalcopyrite, galena, sphalerite and pyrite, with quartz gangue.

KISHORN MINE.**SCOTLAND**

Idle. Office and mine: care Mrs. M. M. H. Stewart, owner, Kishorn, Loch Carron, Rosshire, Scotland. Mine was worked about the close of the eighteenth or opening of the nineteenth century.

KJÖLI KOBBERGRUBER.**NORWAY**

Idle. Mine at Reitan, Aalen, Guldalen, Trondhjem, Norway. Tönne Huitfeldt, owner. Property formerly owned by Kjöli Mines, Ltd. Mine said to have 10-mile aerial tram. Production, 1905, was 27,000 metric tons of cupriferous pyrite.

**KLINGENTHAL-GRASLITZER KUPFERBERGBAU;
GEWERKSCHAFT.****GERMANY**

Mine office: Klingenthal, Saxony, Germany. Erhardt August Scheidt, mgr.; Herr Goring, Richard Keil, C. L. Birk and Gerh. Becker, executive committee; E. von Baczko, mgr.; Herr Utsch, supt. Capitalization 1,000 shares, without assigned value. Employs about 300 men.

The output is handled through the 321' Erhardt-August shaft, and the Helene shaft of the Kupferhübel, the ore consisting of low-grade copper-bearing pyrite. The company also operates the St. Peter Fundgrube.

The plant includes ore-dressing works and a smelter near Barby. The company issued bonds of 2,000,000 marks for the purpose of building a sulphuric acid plant and a new smelter.

KLONDYKE COPPER MINES, N. L.**QUEENSLAND**

Address: care C. N. Clarke, Chillagoe, Queensland, Australia. Organized Feb., 1913, capitalization £12,000, shares £1 par; 3,000 issued to vendor. Owns 30 acres, 5 leases, in Klondyke district, Chillagoe, with favorable copper showings, some miles from the Mammoth Copper Mines smelter at Cardross, near Mungana.

KNOCKMAHON MINES.**IRELAND**

Owned by Bonmahon Copper Mines Development Syndicate, Ltd.

KOKAND COPPER MINES.**RUSSIAN TURKESTAN**

See Novikoff Co.; also Nasaroff & Co. Mines near Naukat. Geology described in Mining Magazine, Dec., 1912, p. 444.

KOKUSEI MINE.**JAPAN**

Main office: Suyuki kogyo honten, Higashiku-bingomach, No. 60, Osaka, Japan. Mine office: Kokusei Mine, Mimasaka katsutagun Kawabemura, Japan. Ekiji Suzuki, owner; Z. Mizunoya, gen. mgr.

Is a small mine, having an ore deposit 840' wide, 1,500' long and proven

to depth of 312'. Ore consists of massive pyrite, with chalcopyrite, chalcite and a little zinc blende occurring in lenticular masses, the largest 60x80' encased in serpentine-like material between clay-slates and igneous tuffs. The surrounding rocks include sandstone and serpentinized igneous rocks. Property has 2 shafts, 168' and 138', respectively, with 12,765' of underground working. Mine was discovered 1878, opened 1882, closed 1909, and reopened 1912. Property is 6 miles from the Samyo & Chugoku railway. Production 1912, 524 tons, at an average mining cost of 14.73 yen and a smelting cost of 4.59 yen. Production of fine copper, 66,000 lbs. Smelter has daily capacity of 75 tons and is located at Bicchu, Japan.

KOMAKI MINE.**JAPAN**

Owned by Mitsu Bishi Goshi-Kwaisha.

KOSAKA MINE.**JAPAN**

Owned by Fujita & Co., at Kosaka, Akita, Japan.

KOUNDOUROVY FRÈRES; A. & G.**RUSSIA**

Address: Poste de Katar, Elisavetpol, Russia. Production, 1912, was 216,000 lbs. copper compared with 1,224,000 lbs. in 1911.

KRISTIANIA MINEKOMPANI.**NORWAY**

Idle. Office: Christiania, Norway. Mine near Skafsasogn, Telemarken, Christiansand, Norway. Property is the Bandakslid Kobbergruber at Skafsas, and the Goli Kobbergruber at Sauland. Company also owns copper claims at Kviteseid.

KRISTIANSSANDS NIKKELRAFFINERINGSVERK.**NORWAY**

Address: Christiania, Norway. Is a smelting and refining company treating copper and nickel mattes, carrying 6 to 8% of these 2 metals combined. The converting plant is the only 1 in the world in which this low-grade matte is bessemerized and 75% metal made.

KUNE MINE.**JAPAN**

Owned by Furukawa Mining Co.

KUNJAS COPPER MINES.**GERMAN S. W. AFRICA**

Near Lüderitzbucht, German S. W. Africa. Owned by Deutsche Kolonialgesellschaft. Veins are on the Kunjas farm, near Lüderitzbucht, within the Territories Concessions, about 60 miles from the Seeheim-Kalkfontein railway line.

KUPFERBERG; GEWERKSCHAFT.**GERMANY**

Mine office: Kreuzberg, Rheinprovinz, Germany. Julius August Böhm, chairman; Emil Guillaume, Otto Haagmann, Otto Langhorst and Gustav Hoffmann, executive committee. Organized under laws of Germany, capitalization 3,000,000 marks, shares 3,000 marks par. Bonds, 1,000,000 marks, at 4½%. Employs about 180 men. Property, carrying copper ore, near Wippföhrth, includes the Danielszug mine, on which development was begun 1903. Management plans further development and the installation of a new boiler plant, air compressor and concentrator. No report for 1912.

KUPFERPLATTE; KUPFERKIESBERGBAU.**AUSTRIA**

Mine office: Kitzbühel, Tyrol, Austria. Property is an ancient mine, carrying bedded deposits of chalcopyrite, with quartz gangue, in Silurian slates. Mine was a small producer in 1905. Idle.

KUSAKURA MINE.**JAPAN**

See Furukawa Mining Co.

KYLOE COPPER MINES, N. L.**NEW SOUTH WALES**

Secretary and office: R. D. Hartwell, Vickery's Chambers, 82 Pitt st., Sydney, N. S. W., Australia. Mine office: Adaminaby, Wallace Co., N. S. W., Australia. J. W. Ashcroft, chairman; Dr. H. C. Taylor Young, A. G. de Lauret and J. T. Toohey, directors; A. J. Dunstan, gen. mgr. For fiscal year ending July 31, 1910, company paid a 10% dividend of £1,000 on pre-

ferred shares, and 2 interim dividends of 6d. each on preference and ordinary shares, giving total dividends of £7,000, and paid a 6d. interim dividend of £3,000 July 30, 1910.

The company's report for the year ending June 29, 1912, shows: Expenditures, £522 19s. additional, or a total of £15,936 for plant and machinery; balance to be carried forward as profit and loss, £6,753; net profit, after allowing £3,984 for depreciation, £1,489, which, with previous credit balance, totals £8,543.

The mine, 3 miles from Adaminaby and 30 miles from Cooma, the nearest rail point, was discovered 1860, and a little ore was extracted from time to time until taken over, 1904, by Schafer Bros., who shipped about 500 long tons of ore, returning 11 to 25% copper, to the Waratah smelter, 1904-07. The ore occurs in a vein of 30" to 6' width, in quartz felsite, passing into aplitic and biotitic granite in the lower levels. The oxidized zone carried rich malachite, azurite and cuprite, ores succeeded at depth of about 40' by quartz carrying chalcopryite with a little bornite and associated with pyrite, impregnations of chalcopryite in the granitic walls. The primary ore, of milling grade, averages about 4.5% copper. The picked ore carried 21.2% copper, 24.3% iron, 28.9% silica and 25% sulphur. The mine has a 410' main shaft, with levels at 120', 200', 300' and 400', opened for 700' in length.

The concentrator has a Krupp ball mill and jigs, treating ore averaging about 4.5% copper, and turns out concentrates of about 16% copper tenor. The froth flotation plant (Minerals Separation Co.) proved a success in 1912. Production for 1912 was 17,650 tons averaging 5.77% copper, yielding 884.43 tons of copper with an 86.81% recovery. The mill treated 16,948 tons of 5.543% ore in 286 days.

In May, 1913, the Kylvoe property was shut down and the directors of the company authorized to consider the acquisition of a new property.

KYOSAKU TAKED.

JAPAN

See Tsubaki Mine.

KYSHTIM CORPORATION, LTD.

RUSSIA

Office: 80 Bishopsgate, London, E. C., England. Operating office; Nevsky Prospect 1, St. Petersburg, Russia. Mine office: Kyshtim, Perm, Russia. C. F. H. Leslie, chairman; L. Urquhart, resident director; Baron Vladimir Meller-Zakomelsky, D. J. Morgan, T. B. Reynolds, S. Polak, A. J. H. Smith, F. Stobart, S. J. Blumlein, H. C. Hoover and R. Gilman Brown, directors; J. P. B. Webster, sec.; R. G. Brown, cons. mg. engr.: W. G. Perkins, cons. met. engr.: H. H. Knox, New York city, advisory cons. engr.

Organized Oct. 29, 1908, under laws of Great Britain, capitalization £1,260,000, shares £1 par; 1,002,800 issued and fully paid. Property is the entire share capital of the Kyshtim Mining Works, a corporation organized 1900, under the laws of Russia, of which Mr. Urquhart is managing director. Debentures authorized and issued, £650,000 at 6%, convertible into shares at £2 10s. per share, 260,000 shares being reserved for this purpose.

Lands, 2,198 sq. miles, or 1,406,700 acres, including iron mines, iron smelters and works, gold mines, copper mines and a copper smelter, the mineral lands covering about 189,000 acres, with 367,200 acres of farm and grazing lands and 850,500 acres of forest lands.

The company's copper and gold mines, in the Soymonovsk valley, about 30 miles from Kyshtim, include a number of copper mines, having lenticular orebodies of considerable size, and are connected with the Main Government railroad by the company's own narrow-gauge road. The principal mines are the Koniukhoff, Smirnoff, Tissoff and Americansky.

The ore reserves were estimated by R. Gilman Brown in Dec., 1912, to

be 2,369,000 long tons, the average being 3% copper, 0.1 oz. gold, and 1 oz. silver per ton. This figure includes only 296,000 tons in the Americansky mine, but since this report was made further development by 7 drill holes has shown the existence of a large orebody in this mine, the ore disclosed to date amounting to more than 700,000 tons, running higher than that of the other mines in both copper and precious metals.

The smelting plant at Karabash, built by Mr. Perkins, consists of 3 water-jacketed furnaces with a capacity of 360,000 tons of ore per annum; in addition, 2 open-hearth reverberatory furnaces are working on fines and flue dust, and a large reverberatory furnace to treat the fine ores is now being erected.

Production in 1912 amounted to 7,507 long tons (5,140 tons, 1911) of blister copper, all of it refined and the gold and silver recovered at the company's electrolytic works. The average net sale price realized in 1912 after paying selling expenses and freight was £96 per ton. (Note—The Russian import duty on copper is £33 per ton.) It is estimated that, with a London price of copper of £60 per ton, the copper department will show a profit, after crediting duty and gold and silver recovered, and debiting selling expenses, of more than £60 per ton refined copper. The output for 1913 is estimated at from 7,600 to 8,000 tons.

In addition to its copper mines and works, the company has 3 iron works on different parts of the estate, the iron plant at Kyshtim making bar iron, that at Niazepetrovsk making sheet iron, and that at Kasli, about 15 miles north of Kyshtim, making castings. The yearly output of iron sheets and castings amounts to 18,000 tons. The company's timber is also being exploited and in addition to providing for fuel and mining requirements, large quantities are sold under contract to the State and other railways. About 2,000 men are employed in all departments.

The company entered the dividend paying list in Dec., 1912, when an interim dividend of 5% free of income tax was paid; the final dividend for 1912 was declared June, 1913.

The copper deposits of the Koniukhoff and Smirnoff mines were first worked for the iron ore forming the gossan. As the workings were deepened, gold-bearing sulphide ores were found, whose copper content increased with depth and diamond drilling showed the existence of large orebodies at these 2 and the Amerikanski mine.

In 1913 the company was negotiating with the Sissert Mining Co. for the Gumeshevsky mines in the Urals.

LADOGA LAKE MINING & SMELTING CO., LTD. FINLAND

Office: Finsbury House, Blomfield St., London, E. C., Eng. Mine office: Pitkäranta, Viborg, Finland. Col. R. G. Sharman Crawford, chairman; H. T. Holmes, director; J. Sargent, sec. Organized March 2, 1908, under laws of Great Britain, capitalization £200,000, shares £1 par; issued, £111,000, of which £100,000 vendors' shares are fully paid, and 11,000 shares are 1s. paid. No recent financial report furnished. Company acquired from C. Cully the Pitkäranta estate with iron and copper mines, smelting works, plant, etc., situated in Impilaks parish, Finland, together with 3 steamers and 10 barges.

Lands, 10,000 acres, mainly well wooded, near Lake Ladoga, carrying iron and copper ores. The Pitkäranta mine, opened 1820, was worked steadily until 1903, making an average annual production of about 750,000 lbs. fine copper during the last decade of operation, and was under the ownership of the Russian Imperial Bank, 1894-1908.

The property carries several orebodies in Archæan rocks. The deposit under development is a granular mixture of augite, garnet and other ferro-

magnesian silicates, known as "skarn" that is shot through with chalcopyrite veinlets. This orebody is 15' thick, has a dip of 40° south, and has been opened at intervals for a length of about 1½ miles. To the eastward the ore occurs as bunches, up to several pounds in weight, and at this end of the workings the orebody is separated into 5 sections, the footwall bed carrying finely disseminated chalcopyrite overlaid by a 2 to 3' layer of barren material, followed in turn by 3' of barren schist, succeeded by a cupriferous bed of about 20" thickness carrying somewhat argentiferous copper sulphides. The company's lands also carry iron ore and are said to have indications of tin.

Company was inadequately financed, paying £175,000 for property with too small a working balance.

LADY FANNY COPPER SYNDICATE, LTD.

QUEENSLAND

Liquidated voluntarily, 1911.

LAKE COPPER PROPRIETARY CO., LTD.

SWEDEN

Office: 103 Cannon St., London, E. C., Eng. Col. A. H. C. Lynch-Staunton, chairman; M. Schreither, M. E., mine mgr., Vingnas. Lake Animinnen, S. W. Sweden; C. Maurice Champness, sec. Organized March 10, 1906, under laws of Great Britain, capitalization £300,000, in 298,000 ordinary shares of £1 par, and 40,000 deferred shares of 1s. par; issued. 255,000 ordinary shares and 40,000 deferred shares. Debentures, £500,000 6% bonds, of which £70,000 are outstanding. Holds lands through Lake Copper Syndicate Aktiebolag, organized under laws of Sweden.

Property, the Stora Strand and Vingnas mines, with 140 mining leases, 1,380 acres, 90 miles north of Gothenberg, Sweden. Orebody on the Stora Strand has been proved for 10 miles and to a depth of 800'. The mine has 13 shafts, 1 of 800' showing ores averaging about 2% copper with small values in gold and silver. At the Vingnas mine several veins are developed by 4 shafts, but no reserves are estimated. Ore in sight at the Stora mine is reported as 110,000 tons.

LAKE COPPER SYNDICATE AKTIEBOLAG.

SWEDEN

Is the Swedish incorporation of the Lake Copper Proprietary Co., Ltd.

LAKE GEORGE MINE.

NEW SOUTH WALES

Idle since 1907. Mine office: Bungendore, Murray Co., N. S. W., Aus. W. J. Channon and J. Plum, owners. Lands, 172 acres, freehold, at Captain's flat, Lake George, about 25 miles south of Bungendore. The mine, about 700' deep, was opened 1882, on a main vein of 22 to 30' width, having a N.-S. strike and vertical dip, in Silurian slates, ore occurring as replacements along fault lines, as a compact, fine-grained mixture of chalcopyrite, sphalerite, galena and pyrite, with aluminous quartzose gangue, carrying an average of about 1.5% copper with small gold and silver values.

The smelter has four 60-ton water jacket blast furnaces. Ore requires heavy fluxing and fuel charges. Pyritic smelting proved unsuccessful.

LALOKI COPPER MINE.

PAPUA

Address: care Great Fitzroy Mines, Ltd., Port Moresby, Papua, British New Guinea. Property is located 17 miles from Port Moresby and the local government is expected to build a railway line to Sapphire creek, 2 miles from the mine. The ore is a basic sulphide which carries 3 to 4% copper and \$2 gold per ton. Development includes a 140' shaft with a 74' level having 88' drifting on the vein. Property is a promising source of much needed pyritic ore for the smelter of the Great Fitzroy Mines, Ltd., in Queensland.

LAMBERT, C. J.; SUCESIÓN.

CHILE

Office, mine and works: La Compañía, La Serena, Coquimbo, Chile. Property includes El Brillador and San Antonio mines, 93 hectares, which

show fissure veins in porphyry, one of about 90' extreme width, with dip of 60°. Sulphide ores appear 100 meters below the outcrop and are said to average 5 to 10% copper. The Fortuna and Placeres mines employed about 150 men at last accounts. Los Bronces mine, formerly owned, was sold to Sociedad Minera de Los Bronces.

The reduction plant, 16 miles from Coquimbo, by railway, includes a 100-ton concentrator and a smelter, using the Welsh system, that was the first modern plant in Chile. This smelter, known as the Fundición La Compañía, has 2 calciners and four 21' reverberatory furnaces, treating ore averaging about 8%, with slags assaying 0.75% copper. Equipment includes two 100-h. p. boilers, two 80-h. p. engines and a small hydraulic turbine. Fuel is Australian coke, costing 20 pesos per ton, delivered. About 80 men are employed at average wages of 1.5 pesos daily. Production formerly was copper sulphate, consumed mainly by smelting plants using the Kröhnke process, but this business was lost, some years ago, and the smelter now produces Chile bars of about 95% copper tenor.

LAMPA MINING CO., LTD.

PERU

Secretary's address: Thos. S. Hancox, 411 Tower Bldg., Liverpool, Eng. Mine office: Santa Lucía Lampá, Puno, Peru. J. Lionel Barber, chairman; H. P. Gamon and S. Downs, directors; R. D. Barber, cons. engr. Organized June 30, 1906, under laws of Great Britain, capitalization £35,000, increased 1911, to £50,000, shares £1 par; issued, £23,280. Debentures, £25,000, authorized, at 7%; issued, £14,000. Lands, 34 hectares, including the Santa Catalina, Rubí, San Otto, San Carlos, Esmeralda and Socavón mines, also a power site, known as Trapiche, and the water power of Toropujani, near Santa Lucía. Ore reserves, 1912, were estimated at 24,000 tons of about 10% copper tenor.

LANGSFORD MINERAL CLAIM.

SOUTH AUSTRALIA

Copper prospect in Lovely gully, 8 miles from Wankaringa, South Australia. Property, formerly owned by the Laura Syndicate, is opened by several shallow shafts and open cuts, showing silicious ironstone carrying seams of copper ore, chiefly malachite, with small gold and silver values.

LAPILLA MINE (MINA LA LAPILLA).

SPAIN

Office and mine: Alosno, Huelva, Spain. Wm. Guthrie Bowie, manager. Property is a group of government concessions, with title standing in the name of Sr. D. Francisco Limón Pebollo, property being owned by a syndicate of local capitalists.

Lands, 100 hectares, in 3 groups, known as the Demasia Lapilla, Demasia Almagrera and Precaución, adjoining the Almagrera and Tharsis mines. Properties were exploited extensively by the ancients who left immense heaps of scoria. Former owner was the Dallas Pyrites Co., work stopping on the death of the late Alexander Grant Dallas. The property carries a very wide lens of cupriferous pyrite, with outcrops traced 1,100 meters, only 220 meters of the extension having been exploited.

The principal workings, at the eastern end, show an orebody up to 45 meters in width, with an average width of 33 meters, for a length of 200 meters, with workings to a depth of 30 meters. There also are old workings at the western end, but the openings are caved so badly that opencast operations are necessary in the central portion. Apparently the balance of ore in the old workings could be obtained by dry walling, to replace the ore mined. The old mine has 2 shafts, each 157' deep, with 3 levels, opened pillar-and-stall, leaving large quantities of good ore in the pillars and floors. The upper workings in the eastern end produced ore of 2.5 to 8% copper tenor, succeeded by ore lower in copper, but of good sulphur tenor. There are about 1,200,000 tons of ore available underground, and

much more if worked opencast. There are evidences of large orebodies to the east of the present workings, and the entire deposit is rich in sulphur and probably workable to good depth, even without any material copper contents. The main shaft is vertical, with headgear and cages.

Equipment includes a 24-h. p. hoist and an air compressor. The mine is served by the Tharsis railway, with rather high freight rates, and somewhat congested traffic. Mine waters, when surcharged, carry 3 kgs. copper per cubic meter, and leaching is conducted in the same manner as at the Cabezas del Pasto mines. This is one of the most promising of the ancient mines of the Iberian peninsula, and is considered capable of making a considerable production, if given adequate development, cheaper transportation, or local reduction works, but should be consolidated with adjoining properties and worked with steam shovels.

LARRAGUIBEL; JOSÉ.

CHILE

Mine office: Algarrobito, La Serena, Coquimbo, Chile. Property is the Pajalones mine, having a vein of 1 meter average width, opened to depth of 130 meters, with horizontal workings for 400 meters length. Production 1903, was 400 metric tons of ore averaging 14% copper tenor, equal to 123,457 lbs. fine copper. Idle.

LAURA DE HUANTAJAYA; COMPANIA MINERA.

CHILE

Mine office: Huantajaya, Tarapacá, Chile. Organized Sept. 26, 1902, under laws of Chile, capitalization 60,000 pesos, shares 300 pesos par. No trace of operations secured and presumably no longer doing business.

LAVINIA DE HUANTAJAYA; SOCIEDAD MINERA.

CHILE

Office: Iquique, Chile. Mine office: Huantajaya, Tarapacá, Chile. Organized Oct. 29, 1906, under laws of Chile, capitalization 100,000 pesos, shares 100 pesos par. Company reported dormant.

LEALTAD COPPER MINE CO.

SPAIN

Office: 5 Blvd. Magenta, Paris, France. Mine address: Dr. Rene Le Fournier, manager, Linares de la Sierra, Huelva, Spain. John R. Catlin, superintendent, at last accounts. Organized July, 1907, under laws of New Jersey, capitalization \$500,000. Property, 17 miles from Almonáster, the nearest rail point, carries copper, nickel and cobalt ores. No recent returns secured.

LEVANT MINING CO., LTD.

ENGLAND

Office: Pendeen, R. S. O., Cornwall, Eng. Mine office: St. Just, Cornwall, Eng. F. F. Oats, chairman; H. Bolitho, W. James, H. Olds, Frank Oats and G. Oats, directors; Maj. Richard White, purser; Capt. Benj. Nicholas, gen. mgr. Organized 1872, under laws of England, as a cost-book company, with 2,500 shares; issued 2,385 shares, on which £16 12s. 6d. per share has been paid in, last call having been 4s., Oct., 1910, with no previous calls 1898 to 1908, with dividend disbursements of £42 18s. 6d. per share, last dividend having been 15s., Dec., 1912. Accounts are made up every 16 weeks. The mine has been worked continuously since 1820, paying £170,000 in dividends during its first 20 years of operation. The mine is now a small producer only of tin and copper ores, mainly the former, but in 1906 produced 2,140 long tons of copper ore of 12% average tenor, yielding 575,000 lbs. fine copper, rendering the Levant the largest copper producer of England.

Operations for year 1911-12 showed an output of 8,557 tons of ore crushed and treated, yielding copper and tin sold for £14,940, at a total cost for labor, etc., of £15,344, or a loss of £404.

LIBIOLA COPPER MINING CO., LTD.

ITALY

Office: Bishopsgate House, 80 Bishopsgate, London, E. C., Eng. Mine office: Sestri Levante, Genoa, Liguria, Italy. Kenneth Haweis James, chair-

man; Thomas V. Anthony and Albert Straube, directors; W. S. Bartlett, sec.; Robert H. Craven, mine mgr. Organized Jan., 1867, under laws of Great Britain, and reconstructed 1888, capitalization £252,000, shares £5 par. Paid dividends of 2s. 6d. in 1903; 3s. 6d. in 1904; 3s. 6d. in 1905; 2s. 6d. in 1907; 2s. in 1908; 1s. 6d. in 1909; 1s. 6d. in 1910; 2s. in 1911; 3s. in 1912, with total dividends of £5 5s. 6d. to end of 1912. Property is worked through a subsidiary company, organized under laws of Italy.

Property, 4 claims, leasehold, 1,000 hectares, also a half-hectare mill site, including the Libiola mine, in the Carrara district. The mine, worked by the Romans, and reopened 1867, has about 10 miles of workings. The property has veins of good average size in serpentine and diabase, carrying a little malachite in the upper workings, but mainly chalcopyrite associated with pyrite, ores estimated by management to average 3.99% copper and 45.9% sulphur, with 82,350 tons of ore blocked out for stoping at the end of 1911.

Equipment includes a 150-h. p. steam plant, 60-h. p. electric plant and a 30-h. p. hydraulic plant, with 90 h. p. used at the mine and 150 h. p. at the mill. There is 1 hoist, and 2 air compressors of 12 drills aggregate capacity. The mine has a machine shop, smithy and carpenter shop, all of stone, and there is a sawmill, with band saws.

The mill, covering 550 square meters, is built of reinforced concrete and stone, and has a daily capacity of 180 tons.

Production was 18,494 tons of ore in 1912, of which about 15% was copper ore averaging 7.22%, production of fine copper being about 463,000 lbs. The company is well managed and by careful handling the property, though small and by no means rich, is made to return satisfactory profits.

LIBIOLA; SOC. ANON. per L'ESERCIZIO DELLA

MINIERE DI.

ITALY

Mine office: Sestri Levante, Genoa, Liguria, Italy. Property under lease to the Libiola Copper Mining Co., Ltd., and described thereunder.

LIGURE RAMIFERA; SOCIETÀ.

ITALY

In liquidation, 1913. Office: Genoa, Italy. Mine office: Casarza, Genoa, Italy. Lands include a number of small and old copper properties, including the Bargone and Gallinaria mines at Casarza, Genoa; the Bordeneto and Monte Loreto mines at Castiglione, Genoa, and the Monte Capra, Fontanelle, Rio Albareta, Rio Monticello and Rio dei Fichi mines, in the vicinity, these properties all carrying chalcopyrite, with quartzose gangue.

LITHGOW SMELTER.

NEW SOUTH WALES

Owned by Great Cobar, Ltd., at Lithgow, Cook Co., N. S. W., Aus.

LIVERPOOL SILVER & COPPER CO., LTD.

ENGLAND

Works office: Widnes, Lancashire, Eng. Property is a small reduction plant having an electrolytic refinery with capacity for 700 tons monthly, and a sulphate of copper plant.

LLAILLAI SMELTER.

CHILE

Owned by Guillermo Carvallo, at Llaillai, Valparaiso, Chile.

"LLOYD" COPPER CO., LTD.

NEW SOUTH WALES

Colonial secretary and address: J. Sarram, 31 Lombard Chambers, 107 Pitt St., Sydney, N. S. W., Aus. English secretary: H. A. McMahon, Winchester House, London, E. C., Eng. Mine office: Burruga, Bathurst Co., N. S. W., Aus. C. J. McMahon, chairman; W. Soutar, colonial director; preceding officers, A. E. Barton, F. H. Aaron, Alex. Creighton Arthur and J. T. Mail, directors; J. O. Armstrong, gen. mgr.; Dr. R. Logan Jack, cons. engr.

Organized May 9, 1899, capitalization £250,000, increased Nov., 1906,

to £300,000, and reorganized April 15, 1912, capitalization £280,000, shares £1 par; issued 235,000 shares, 19s. 6d. paid. Capitalization was increased £50,000 to extinguish an equal amount of 10% debentures. Company had a share interest in the Murrin Copper Co., Ltd., which proved a failure. Profits, 1907, were £32,419, from which a 1s. dividend, of £15,000, was paid March 2, 1907.

Lands, 853 acres, formerly known as the Burraga and Thompson's Creek mine, 1 mile from Burraga, in the Bathurst district, which is arid, and operations are suspended at uncomfortably frequent intervals from lack of water, though the mine has an 85,000,000-gal. storage tank holding about 9 months' water supply.

Ore carries slightly argentiferous chalcopyrite, with quartz gangue, occurring in fissure veins traversing acid diorite. The main vein has an ore shoot of about 700' length worked to depth of 750'. The vein ranges 3 to 8' in width, with an average of about 5'. The ore is highly silicious and gave average returns 1907, of 2.36% copper. To the eastward is a fault cutting off the extension of the vein from the 1st to the 14th levels, but protracted search has shown a continuation of the vein, to the eastward of the fault, which has given a 300' horizontal downthrow, the discovery of the extension greatly improving the prospects of the property. The future of the mine apparently depends upon the eastern ground, as it is practically worked out between the Melbourne and Sydney faults. Ore reserves at end of 1912 are estimated at 120,000 tons of about 4% copper tenor.

Equipment includes steam and electric power, with hoists. Buildings include necessary shops and mine structures. Fuel is hardwood, about 75 choppers being employed when the property is in operation, as fuel requirements are about 60,000 cords yearly. Much trouble is experienced from shortage of wood. A 9-mile tram line was built 1912, at a cost of about £20,000. About 500 men are employed, normally.

The reduction plant includes a concentrator and smelter, built 1901, at a cost of £32,000, and overhauled and enlarged 1906. Present equipment includes a 40-ton calcining furnace, 19x48' over all, treating 40-ton charges of matte, and a reverberatory furnace, 23x65' over all, hearth having an inside width of 20', with grate area of 6x8', and 5 charging hoppers; 64% matte is made and shipped direct to the refinery. A Minerals Separation plant for froth flotation concentration is being erected, 1913.

From beginning of mining to the end of 1908, when operations ceased, the company smelted 389,221 long tons of ore, yielding 15,812 long tons of fine copper, largest production having been 2,947,200 lbs. in 1902. Production was resumed Jan., 1913, being about 110 tons of ore daily, of which about 10 tons is 12% smelting ore and the balance is milled, yielding 18 tons of 14% copper concentrate.

LOBBS HOLE COPPER MINE, N. L.

NEW SOUTH WALES

In liquidation. Alex. Jobson, liquidator, Ocean House, Moore St., Sydney, N. S. W., Aus. Mine near Kiandra, Wallace Co., N. S. W., Aus. Organized April 30, 1907, under laws of New South Wales, capitalization £50,000, shares £1 par, in half full-paid and half 10s. paid shares.

Lands, 4 claims, leasehold, 140 acres, 12 miles from Kiandra and 45 miles from a railway, are located in the bottom of a deep gorge, blocked by snow each winter. The property shows fissure veins in Silurian slate, the main vein traceable 1,500', ranging up to 4' in extreme width, but averaging 4 to 18", with a paystreak of about 7" width, partly massive chalcopyrite, estimated to average about 12% copper and easily hand-sorted to 28% average copper tenor. Development is by a 210' main shaft, with crosscut tunnels of 50' and 120', the mine having about 2,000' of workings.

The mine was discovered 1874, and worked intermittently until taken over by the present company, yielding, to end of 1906, about 2,000 tons of selected ore averaging about 28% copper, with 2,000 tons of second-grade ore stocked at the mine, part of which has been washed away by floods.

A hydraulic installation with a Pelton wheel develops 120 h. p. from the Yarrangobilly river, and there is 1 hoist.

The smelter, receiving ore from the mine by tram, has a 20-ton reverberatory furnace, making matte of 45 to 50% copper tenor. Mine was let on 4 years' tribute, May 9, 1910, but has been practically idle since Aug., 1912.

LOBRAR SMELTER (FUNDICION DE LOBRAR).

CHILE

Owned by Tomas Morambio, Lobrar, Atacama, Chile.

LOGANOFF; PRINCE G. G.

TURKESTAN

Mine office: Naukutsy, Namagan, Ferghana, Turkestan. Property includes the Naukutsy and Rostovsky copper mines, opened by shafts and equipped with steam power. Production is 10,840 tons of silicious sulphide copper ore annually.

LOHMANN; CARLOS.

PERU

Mine office: Quequeña, Arequipa, Peru. Lands, 70 hectares, including Tres Cerros and Cerro Verde mines. Los Tres Cerros mine, in the district of Quequeña, 27 kilometers from Arequipa, produces sulphide ores said to average 12% copper, 6 oz. silver and 3 to 4 grams gold per metric ton, employing about 40 men, normally. El Cerro Verde mine, in the district of Uchumayo, 4 hours by rail from Arequipa, has produced copper ores, including cuprite and chalcopyrite, and is said to show large bodies of ore of good average copper tenor.

LONDON METAL BANKING CO., LTD.

NEW SOUTH WALES

Office: 18 Fenchurch St., London, E. C., Eng. Company owns and operates the Gulf Creek copper mine, at Gulf creek, via Barraba, N. S. W., Aus.

LONDON VENTURE CORPORATION, LTD.

F. Cook, liquidator, 16 Philpot Lane, London, E. C., Eng. Reconstructed 1913, as Venture Trust, Ltd.

LORD LAMINGTON MINE.

QUEENSLAND

Mine address: Mount Morgan, Raglan Co., Queensland. Lands, 40 acres, 3 miles east of Mount Morgan, developed by a 52' shaft, show black oxide of copper with small gold values. A test shipment of 20 tons, 1912, yielded 5% copper and 50 cts. gold per ton. The mine was idle the first half of 1913, but was reported to be operating on a small scale in Sept., 1913.

LOS ANGELES; COMPANIA MINERA.

BOLIVIA

Mine near Coro Coro, La Paz, Bolivia. Is a small producer of native copper from the sandstone and conglomerate strata of this locality.

LOTA i CORONEL; NUEVA SOCIEDAD COMPANIA DE.

CHILE

Office: Valparaíso, Chile. Mine offices: Carrizalillo, Chañaral, Atacama, Chile, and Algarrobo, Copiapó, Atacama, Chile. Works offices: Lota, Concepción, Atacama, Chile, and Los Condes, Santiago, Chile. Santiago Collins, manager. Organized under laws of Chile, capitalization 18,000,000 pesos.

Lands include the Mina Descubridora, at Carrizalillo, opened 1850, which is about 650' in depth; the Lota mine, at Lota, opened 1856, and the Maitenes mine, at Los Condes, opened 1844. These properties carry large bodies of ore low in average copper tenor and high in silica, rendering them difficult of reduction. The company also owns coal mines, including the Bueno

Retiro, 5 kilometers north of Coronel, and the Hacienda de Coronel. These mines have steam and electric power, with railroad service.

The Mina Viuda, 5 pertenencias, at Mineral del Algarrobo, in the vicinity of Caldera, has a vein of about 4' average width, carrying chalcoppyrite, and has been developed on a considerable scale, to depth of 377 meters, and for a horizontal length of 325 meters.

The Lota smelter, Fundición de Lota, employs 300 to 350 men, at average wages of 4 pesos daily, and is the principal custom smelter of Chile. The works include a mill with crushers and 3 sets of rolls. The smelter has 16 small reverberatories for calcining, 6 small casting furnaces for matte, 6 small casting furnaces for Chile bars, 1 casting furnace for ingots, and 3 water-jacket blast furnaces. Product is Chile bars averaging 99.5% copper. Slags, averaging above 1% copper are granulated and washed out in a launder. Equipment includes 2 blowing engines, 5 small engines of 43 h. p. each, and hydraulic turbines aggregating 204 h. p. The works have electric light. Sea water for steaming purposes and general use is distilled to the extent of about 10 tons daily, being evaporated in 2 circular wooden tanks, for supplying the water-jackets. Fuel is domestic coal, of poor quality, costing 10 pesos per metric ton, and domestic coke, 5 tons of which are required to reduce 1 ton of ore.

The Maitenes smelter is at Los Condes, 45 kilometers from Santiago, the nearest rail point, with freight rates of 7 pesos per metric ton in, and 6 pesos out. The works include a crushing plant, 3 reverberatory furnaces and a 30-ton cylindrical water-jacket blast furnace, that was doing semipyrritic smelting 1909, on ores from Los Bronces district. This was the first Chilean smelter to install converters, which were added 1885, but the converter plant was practically abandoned 1903, because inadequate matte supply for continuous work rendered the cost of conversion prohibitory. The converter department has four 56x72" shells, and an air compressor plant.

The Viuda smelter, acquired 1908, in connection with the Mina Viuda and other mines at Algarrobo, has a 53x66" water-jacket blast furnace, No. 5 Connorsville blower, and a pump for water circulation.

The smelters are by no means up to date, but the practice has been carefully adapted to local conditions, and the company maintains its position as the leading custom smelter of Chile.

LOVEDEN MINING CO. (1903), LTD.

WALES

Office: 52 Queen Victoria St., London, E. C., Eng. Mine office: Penrhyngerwyn, Cardiganshire, Wales. Wm. E. Martin, director. Organized Dec. 9, 1903, under laws of Great Britain, capitalization £30,000, shares 5s. par. Debentures, £3,500 authorized; £2,700 outstanding. Property is a lead and copper mine, 150 acres, on the Farm Penrhyngerwyn, held under lease for several years.

LYELL CONSOLS MINE.

TASMANIA

See Mt. Lyell Consols Copper Mines, N. L.

LYNGENFJORD KOBBERVÆRK.

NORWAY

Owned by Norwegian-American Copper Mining & Smelting Co.

LYON'S BALFOUR COPPER ASSOCIATION.

TASMANIA

Office: Hobart, Tasmania. Mine office: Mt. Balfour, Russell Co., Tasmania. John Kennedy, E. Maxwell, J. Grimmond, J. Crowe, Hon. C. E. Davies, A. Ashbolt, T. Ball, Howard Wright and Geo. Becham, directors; J. H. Lyon, manager. Lands, 4 sections, 160 acres, showing in the middle claim a N.-S. lode of honeycomb quartz with chalcoppyrite and covellite. Property lies east of and across the Lindsay river gorge, from the holdings of the Mt. Lyell Mining & Railway Co., Ltd.

MACDONALD COPPER MINES, LTD.**QUEENSLAND**

Address: A. Hughes, secretary, 88 West Regent St., Glasgow, Scotland. Mine office: Chillagoe, Lynd Co., Queensland, Aus. H. Allan, R. T. Moore and A. Macdonald, directors; A. M. Hawkes, gen. mgr. Organized May 27, 1910, under laws of Great Britain, capitalization £12,500, shares £1 par; issued 10,000 shares. Property is the Jubilee mine, near Mungana, acquired for £5,000 in fully paid shares.

MAGALLANES; SOC. ESPLIT. DE MINAS DE.**CHILE**

Office and mine: Punta Arenas, Magallanes, Chile. Organized Oct. 20, 1904, under laws of Chile, capitalization £15,000, shares £1 par. Was a prospect on which little or no work was done. The district has been recently active, but this company appears dormant.

MAGPIE COPPER MINE.**QUEENSLAND**

Mine address: Mount Emma, Balurga Co., Queensland. Olsen and Mallet, owners. Has high-grade copper ores, and early 1913, was shipping 30 tons monthly to the Chillagoe smelters. Employs 6 men.

MAIDENPEK; SOC. ANON. DES MINES DE CUIVRE DE.**SERVIA**

Office: Brussels, Belgium. Mine office: Majdanpek, Servia. Employs 500 men. Emile Thorez, chairman; Emile Fromont, mgr.; Chas. Brunard, sec.; Leo Zenzes, mgr.; Alfred Müller, smelter supt., at last accounts. Organized 1903, under laws of Belgium, and legalized in Servia, capitalization 5,000,000 francs, shares 500 francs par. Profits were £7,588 in 1910 and £12,480 in 1911.

Lands are mineral concessions covering 18,800 hectares, 10 miles from the Danube and 75 miles N. E. of Belgrade, showing limestone cut by banatite, a granular, igneous rock. The orebodies carry chalcopryrite, with some chalcocite, bornite and covellite, associated with pyrite and occasional magnetite, in quartzose gangue, ores averaging about 3% copper, 0.4 oz. silver and 75 cts. gold per ton. Property examined by Brenton Symons, M. I. C. E., in 1912.

Transportation is furnished by a 10-mile Bleichert aerial tram, from the mine to the Danube, and there is a half mile Bleichert aerial tram between the mine and smelter.

The smelter formerly had three 40-ton Herreshoff water-jacket blast furnaces, and a 200-ton blast furnace was installed 1907, to employ the Knudsen pyritic process of smelting. Product is blister copper, averaging 96% copper, 14 oz. silver and 1.5 oz. gold per ton. The mines produced, 1912, in addition to copper, about 37,000 tons of iron pyrites of $\frac{1}{2}$ to 1% copper tenor.

MAIPO; COMPAÑIA MINERA DE.**CHILE**

Mine office: Cajon de Maipo, Victoria, Santiago, Chile. Works office: El Volcan, Victoria, Santiago, Chile. Gregorio Donoso, general manager.

Property includes El Volcan, San Simón, Juanita and other mines, carrying about 2,500 meters of the strike of a vein 3 to 16' thick, cutting sedimentary rocks and syenite. The vein runs N. 45° E., is nearly vertical and averages 7' wide. The upper portion of the vein is strongly ferruginous and micaceous, with limestone and quartz gangue, the oxidized ores are followed, at slight depth, by chalcopryrite. The general average of the ore is 4 to 5%. The ore is picked to eliminate iron. Greatest depth of mine is about 170 meters, and workings extend for a distance of 1,800 meters.

The mine has 4 Siemens & Halske electric drills, taking a 305-volt current at 3 amperes, and these machines have given excellent results, despite troubles with similar drills at other Chilean mines.

The mill has a Blake crusher and an Elmore vacuum oil flotation process plant, which is said to have given very good results.

The smelter has four 54" circular water-jacket blast furnaces, and two 36x72" quadrangular blast furnaces, with room for a third. Improvements have reduced coke charges from 18% to about 14%, increased the capacity of the larger furnaces from 50 tons to 65 metric tons per day, and lengthened the campaign of each furnace to 35 days, from the former figure of only 20 days. Fuel is imported coke, costing 47 pesos per ton, delivered. Slags from low-grade ores occasionally run as low as 0.1%. There are 6 Connorsville and Fargot et Fils blowers. The converter department has 1 platform, with five 1.68x1.82-meter shells, converting 20 tons of 45% matte into 9 tons of 98% blister copper in 8 operations. Freight rate on matte and Chile bars is 23.3 pesos per metric ton, to the seaboard. Forces average about 600 men at the mines and works at average wages of 3 pesos daily.

The power plant, at the smelter, takes water from the Volcan river, a tributary of the Rio Maipo, with ample supply. There are 100-h. p. and 200-h. p. turbines, direct-connected to 2 Siemens & Halske dynamos, generating electric power at 440 volts for the hoists, blowing engines and pumps.

MAITENES SMELTER.

CHILE

Owned by Nueva Sociedad Compañía de Iota i Coronel, at Los Condes, Santiago, Chile.

MAKIMINE MINE.

JAPAN

Owned by Mitsu Bishi Goshi-Kwaisha.

MALDINI DE COLLAHUASI; SOCIEDAD.

CHILE

Office: Iquique, Chile. Mine office: Collahuasi, Tarapacá, Chile. Organized Aug. 8, 1905, under laws of Chile, capitalization 160,000 pesos, shares 100 pesos par. Letters returned unclaimed from Iquique.

MALGO DEVELOPING SYNDICATE, LTD.

TRANSVAAL

P. O. address: Box 486, Johannesburg, S. A. Mine office: Motale, Zoutpansberg, Transvaal. J. M. Calderwood, consulting engineer. Organized Nov., 1909, under laws of Transvaal, capitalization £10,000, increased Oct., 1910, to £12,500. Lands, 3,500 claims, on the Motale river, between Molena and Motale, in a tract 1 mile wide and 9 miles long, cut by the Motale river, carrying 4 veins. The property is 165 miles from a railway, but an extension of the Selati line is hoped for. Lands carry copper and iron ores, coal and limestone, and water power is available. Work was begun 1909, and about 1,000' of openings were made in the first year. Development is by 4 shafts, of 60 to 145', with a 100' tunnel and 500' drift, developing a 3' vein carrying malachite, chalcocite and gray copper, giving assays up to 29% copper. Native labor is abundant and good. Has steam power. Company refuses information, 1913.

MALSAA COPPER WORKS.

NORWAY

Office: care H. & F. Bachke, owners, Drontheim, Norway. Property comprises the Archbold and Crowe mines, situated in the parish of Vaerdalen, North Drontheim county. Inactive at present.

MAMISSON COPPER SYNDICATE, LTD.

RUSSIA

In liquidation. C. Hand, 74 Coleman St., London, E. C., Eng., liquidator.

MAMMOTH COPPER MINE, LTD.

QUEENSLAND

Secretary's address: A. Hughes, 88 West Regent St., Glasgow, Scotland. Mine office: Cardross via Mungana, Chillagoe, Queensland. A. Macdonald, R. T. Moore and H. Allen, directors; J. D. Audley Smith, cons. engr.; C. G. Rutledge, gen. mgr. Organized May 20, 1907, under laws of Great Britain, capitalization £10,000, increased to £55,000, shares £1 par; issued, £17,000.

Lands, 27 claims, 210 acres, in 5 groups, 1 to 12 miles from Klondye,

and about 25 miles N. W. of Mungana, including water rights on the Walsh river.

The Keppoch mine, 20 acres, about 1 mile east of Klondyke, has a 6' vein carrying 18" and 24" footwall and hanging-wall paystreaks, giving assays of about 8% copper and 1 oz. gold per ton, developed by a shallow shaft, having a steam hoist.

The Mountain Maid mine, about 5 miles south of Klondyke, showing 2 prominent outcrops, is developed by a 42' incline shaft, and what is called a vertical shaft, sunk for first 25' vertically, and for 128' below at 80°. Drifts on the bottom are in ore assaying up to 15% copper, with traces of silver and gold. Equipment includes a 6-drill air compressor.

The Chieftain mine, acquired 1911, is developed by a 172' shaft. The openings above the 110' level show a 20' vein of chalcopryite carrying up to 14% copper, \$2 gold and 5 oz. silver per ton. Ore reserves are estimated at 35,000 tons of about 8.5% copper tenor. The shaft is equipped with a steam hoist good for a depth of about 300'.

The smelter, erected 1912, of 70 tons daily capacity, has a 34x120" W. J. blast furnace, making copper matte of about 40% copper tenor which is sent to Chillagoe for conversion into blister copper.

MAMPEI IMAMURA.

JAPAN

See Inari mine.

MANSFELD COPPERSCHIST MINING CO.

GERMANY

(MANSFELD'SCHE KUPFERSCHIEFERBAUENDE GEW.)

Mine office: Eisleben. Prussian Saxony, Germany. Dr. Dittrich, Dr. Lehmann, Dr. Lengnick, E. Kreuser, Br. Windisch and I. J. Tobias executive committee; Bergrat Dr. Vogelsang, gen. mgr.; Rudolph Franke, gen. smelter supt.; Herr Ludwig, gen. mg. supt.

Organized 1852, as a consolidation of numerous independent operators, and reorganized, April 10, 1876, under laws of Prussia, capitalization 69,120 shares, apparently without assigned value. Dividends have been: 90 marks per share in 1900; 45 marks in 1901; 15 marks in 1902; 40 marks in 1903; 40 marks in 1904; 80 marks in 1905; 120 marks in 1906; 70 marks in 1907; nothing in 1908 and 1909; 10 marks in 1910; 15 marks in 1911; 45 marks in 1912.

Treasury shares to the amount of 2,000,000 marks, and a new issue of 5,000,000 marks, were authorized 1908, to provide for the deepening of shafts, the rebuilding and enlarging of the electrical plants at the Krughütte and Kupferkammer works, the construction of new copper and brass works at Hettstedt, and other improvements.

Forces employed are upwards of 22,000 men, and exclusive of the Westfalen coal mines, averaged 19,735 men 1912, of whom about 70% were employed at the mines and 13% at the smelters.

Lands are very extensive, including besides the Mansfeld copper mine, large coal mines in Westphalia, and a potash bed near Wansleben, opened by 1 shaft, which has been in operation since 1903. Landed holdings also include considerable tracts of forest.

The coal mines at Langendreer, near Hamm, Westfalen, include several adjoining mines, with 4 operating shafts, and in connection is a coke plant of about 225,000 metric tons yearly capacity, production averaging about 2,500 metric tons of coal and coke daily. There are 2 crushing plants, 1 near Walzwerke and the other at Rothenberg.

The Mansfeld mine was opened A. D. 1199, was immensely profitable during the fourteenth and fifteenth centuries, but the industry nearly suffered extinction during the Thirty Years' War. Activity was resumed in 1671, when the right of working the mines was declared free, this resulting

in the building up of a great number of small independent operators. The present company was first formed 1852, as a consolidation of the various small mine operators and smelters, and the merging of many small interests has resulted in a nearly seventeenfold increase of production, from 1,179 metric tons fine copper and 6,489 kilograms silver in 1852.

The principal orebody of the Mansfeld mines is the kupferschiefer, a fine-grained bituminous shale, lying nearly horizontal, having a dip of about 5° only, with average thickness of 1', of which only 8" are workable, but covering several hundred sq. miles. The principal ore is slightly argentiferous chalcopryite, bornite and chalcocite, occurring as speiss, disseminated in very fine grains through the kupferschiefer. Lying just under the kupferschiefer is an arenaceous shale, carrying chalcopryite. There also is a slightly cupriferous limestone bed, known as the Dachberg. The kupferschiefer carries 2.9 to 10% copper, and ores smelted average 2.5 to 3% copper and 0.015 to 0.020% silver.

The mine has been modernized in methods and equipment since the beginning of the 20th century. Owing to the great age and extent of the old workings, the headings usually were 2 to 4 kilometers from the shafts, hence the actual mining was done under considerable disadvantages, the thinness of the bed and the great extent of the workings rendering it necessary for the miners to work on their sides, bellies or backs, as in coal mines, wearing boards upon their trunks and thighs, in order to protect themselves from the rock floors. Present mining operations are through a row of 6 deep-level hoisting shafts, intersecting the kupferschiefer at depths of 300 to 600 meters. Three other shafts reach the seam at still greater depths, and 2 of these also intersect a bed of excellent carnallite. These shafts are all circular, 6 meters in diameter, with a lining of brick, backed by concrete. Many of the scores of old shafts, which average about 400 meters in depth, are used for ventilation, safety and raising water. The principal new shafts are the Hohenthal, at Helbra, the Herman, at Helfta, and the Paul, at Helmsdorf. All new shafts have steel headgears. Underground haulage, formerly done by horses, is to be supplanted by electric locomotives, in the newer workings. Ore is hand-sorted on reaching surface, and waste rock, including considerable limestone, is used for underground filling.

Water from the entire mine is drained to the Hohenthal, Ernst and Niewandt shafts, whence it is raised by steam and electric pumps to the main adit, 150 meters below surface.

The machinery equipment of the mine is very complete. The shafts have mainly cross-compound steam hoists, with conical drums for deep winding, but the Hermann and Paul shafts and the newer exploratory shafts have Ilgner electric hoists. All hoisting is done by double-deck cages, raising 4 trucks. Electric power is used extensively and increasingly, and this is developed mainly from gas installations, with power stations at the Krughütte and Kupferkammer reduction plants.

The company maintains independent machine shops, capable of repairing or building any mining or pumping machinery in use, and also has extensive smithies and wood-working shops.

The Krughütte gas power station has two 1,300-h. p. units, the blast furnaces being connected with 2 parallel gas trunks, taking blast gases to a purifier house, where there are Zschokke and Theisen centrifugal washers, through which the gas passes, and is then dried by passing through a Theisen vapor separator, going thence to a gasometer of 500 cubic meters capacity, from whence it is drawn, as required, to two 1,300-h. p. Ochelhäuser gas engines, direct-connected to a Siemens-Schuckert 3-phase alter-

nator of revolving field type. Current is transmitted to various works at 3,000 to 10,000 volts, and there stepped down for use.

Transportation is by railway lines and a number of Otto aerial trams, the Hermann mine having a 7-kilometer electric aerial tram.

The Mansfeld has numerous reduction plants, including 2 smelters for raw ores, 2 roasting smelters with acid plants, 2 matte smelting works, and a desilverizing plant, the various works having a total of 13 reverberatory furnaces.

The method of reduction is by heap roasting, and calcining in shaft furnaces. Roast heaps are built about 1,000 meters long, 6.5 meters broad at the bottom and 3.5 meters broad at the top, and 2 meters high. The only fuel used is a little brushwood, at the edges and bottoms of heaps, and each heap is roasted about 4 weeks. If the ore carries any fines, these are screened, briquetted and added to the roast heaps. Roasting reduces the ore 7 to 10% in weight, and is more for the elimination of carbon dioxide and bituminous matter than to throw off sulphur, the latter running only 2 to 3% in the raw ore, while the bituminous matter ranges 10 to 17%, and carbon dioxide 7 to 13%. There are 2 roast stalls near the shafts, and at the furnaces the first-fusion product is a matte carrying 40% copper and 0.25% silver. This matte is broken up and roasted in 2 calcining kilns, and the roasted matte, with the addition of 5 to 10% raw matte, is smelted in reverberatory furnaces to white metal carrying 74 to 75% copper and 0.45 to 0.50% silver. The slags from the white metal carry 4 to 6% copper and are returned to the shaft furnaces. Slag is utilized extensively for the manufacture of slag brick and paving blocks. The white metal is ground in Krupp ball mills and sent to the Saigerhütte refinery.

The Kochhütte, at Helbra, is the principal smelter, treating about three-fifths of the total production. There are 8 furnaces, 1 held in reserve, of circular shaft type, using cold blast.

The Krughütte treats about two-fifths of the total production. This plant, at Eisleben, near the mines, has 6 furnaces, 1 being held as a spare, of circular shaft type, with forehearths, using cold blast.

The Eckardthütte, at Leimbach, has 4 copper furnaces of circular shaft type, using cold blast. This plant also has 1 lead stack, producing silver-lead matte, and makes a little nickel speiss from resmelted flue dust. In connection with the Eckardthütte is an acid plant having 72 kilns and 5 lead acid chambers, using the chamber process of acid making.

The Kupferkammerhütte, at Hettstedt, has 3 furnaces of circular shaft type, but, unlike the other plants, employs a hot blast to some extent. The acid plant at the Kupferkammerhütte has 82 kilns and 6 lead acid chambers, turning out 50 metric tons of 50° Beaumé sulphuric acid weekly.

The Gottesbelohnungshütte is one of the smaller and less modern smelters, equipment consisting of 13 small reverberatory furnaces, 17 roasting furnaces and 2 small furnaces for refining slags.

The Saigerhütte is mainly a refinery, including a desilverizing plant, operating on the Ziervogel process, which roasts the matte and retains the silver as a sulphate, which is dissolved in water and the solution run over metallic copper, which precipitates the silver, the cement silver so secured being pressed and resmelted to metal .999 fine. The final furnace product, after the extraction of the silver, is blister copper of 99.7 to 99.8% tenor.

Production, which was only 5,865,898 lbs. in 1867, increased to 15,230,287 lbs. in 1877, to 29,176,000 lbs. in 1887, and 40,230,400 lbs. in 1897. Recent production has been as follows: 42,500,278 lbs. in 1903; 41,629,349 lbs. in 1904; 43,824,141 lbs. in 1905; 40,108,000 lbs. in 1906; 38,822,000 lbs. in 1907; 39,686,800 lbs. in 1908; 41,891,400 lbs. in 1909; 44,769,800 lbs. in 1910; 45,955,600

lbs. in 1911; 45,188,600 lbs. in 1912. Production in 1912 was secured from 873,305 metric tons of cupriferous material smelted. The Mansfield is handled with high technical skill, and its orebodies, by reason of their vast extent, are among the very largest known to man.

MANUEL CALDERON.**BOLIVIA**

See Calderon.

MANY PEAKS COPPER MINING CO., LTD.**QUEENSLAND**

Mine office: Miriam Vale, Flinders Co., Queensland, Aus. Capitalization £2,041, shares 6d. par. Property is under lease, since 1906, to the Mt. Morgan Gold Mining Co., Ltd., and is practically owned by that company. The lease, which is irrevocable by the Many Peaks Copper Mining Co., Ltd., calls for a minimum extraction of 25,000 long tons of ore yearly, on a royalty of 6s. 2d. per ton. For the year ending June 30, 1913, the company received £12,381 as royalty.

Lands, 320 acres, well timbered, 25 miles S. W. of Miriam Vale. The property shows promising gossan outcrops, carrying occasional small quantities of copper ore, with a vein up to 90' in width, oxidized to some little depth, but apparently having no secondary sulphides, the zone of oxidation being succeeded by chalcopryite of about 3.5% copper tenor. Development is exclusively by 3 tunnels, the main tunnel being on the 470' level, with 3 levels above, at 100' intervals, these and the main tunnel being driven nearly due south from a gully near the northern end of the property. The walls are somewhat treacherous and require careful attention. During 1912-13, a winze was put down to the 570' level and a 100' drift opened and stopping begun. Ore reserves were estimated 1912, at 1,000,000 tons.

Production for the year ending May 31, 1913, was 99,051 long tons of ore, estimated to carry 3,000,000 lbs. copper and 500 oz. silver. The ore is low in grade but exists in large quantities and is valuable to the Mt. Morgan Co., and it might be difficult for any independent interest to handle the mine as profitably.

MAORILAND COPPER CO., LTD.**NEW ZEALAND**

Office: Christchurch, N. Z. Mine office: Nelson, Waimea Co., N. Z. Harley E. Hooper, gen. mgr.; Edwin Bray, mine mgr.

Property includes several different mines, with 2,000 acres of land. The mines, which show considerable native copper and rich secondary ores, are accessible by good wagon road from Nelson. Principal properties are the United Champion, which has 2 separate mines, carrying mainly chalcopryite ore, opened by a 250' shaft and various tunnels, showing a vein up to 14' in width having 14,603' of workings in 1908. The Monster mine, developed opencast, shows chalcopryite giving average assays of 17% copper and 4 dwts. 17 grains gold per long ton. The Mount Claude mine, opened by tunnels, shows a vein of about 4' width, carrying oxidized ores with a gossan up to 250' width, said to give average assays of 5% copper and 3.8 dwts. gold per long ton. The Doctor mine shows considerable chalcocite and some native copper in a vein up to 11' in width.

The smelter, connected with the mines by a tramway, was built as long ago as 1908, but, by reason of the ore being highly aluminous, the mine was not showing very good results at last accounts and is now closed down.

MARAMBIO; TOMAS.**CHILE**

Office and mine: Peña Blanca, Atacama, Chile. Works office: Labrar, Chile. Property includes a number of mines and a smelter.

The Santa Rosa mine, at Fragueta, 8 leagues from Peña Blanca, is 220 meters deep, has 1,600' level workings opening a vein of 6' average thick-

ness that runs N.-S. and dips at 45°. The Mina Verde, near the Santa Rosa, opened to a depth of 130 meters, produces ore with 18% copper.

The Mina Pequeña, 12 miles from Peña Blanca, is opened to depth of 50 meters only, showing an oxidized zone of about 30 meters depth. The Mina Sereña is opened to a depth of 70 meters, with workings for a horizontal length of 160 meters. The Mina Manto has an outcrop traceable 500 meters and is opened to depth of 120 meters.

The Mina María Luisa is opened to depth of 140 meters. The Mina San Juan was worked originally for silver ore, which changed to copper with depth, and is said to have a 1,800' shaft, which probably is a mistaken figure. The Mina Quebradilla, at San Juan, 13 kilometers from Peña Blanca, has a vein of about 1 meter width, traversing syenite, and is opened for a length of about 300 meters. This property is the principal producer.

The smelter, known as the Fundición de Labrar, is 16 kilometers from Peña Blanca, and 18 kilometers from a railway, employing normally 50 men at average wages of 3 pesos daily. The smelter has a 11x20' reverberatory furnace, with a 50' smokestack.

MARGAM COPPER WORKS.

WALES

Owned by Vivian & Sons and described under that title.

MARQUEQUI; ANGEL.

BOLIVIA

Office and mine: Coro Coro, La Paz, Bolivia. Owns the San Miguel and Toldo mines, carrying native copper in conglomerate strata. Has steam power and has been a small producer of barillas de cobre for some years. No recent returns secured.

MASON & BARRY, LTD.

PORTUGAL

Office: 87 Cannon St., London, E. C., Eng. Mine office: Pomarao, Alemtejo, Portugal. Jas. Francis Mason, J. P., M. P., chairman; D. H. Barry, deputy chairman; Edw. O. Barry, managing director; preceding officers, Henry E. Beddington and Francis Ricardo, directors; Philip O'D. Greene, sec.; Wm. Neville, resident mgr.; Harvey & Wilbraham, cons. engrs.

Organized June, 1878, under laws of Great Britain, and reorganized June 2, 1892, capitalization £210,000, shares £1 par; issued, £185,172. Capitalization was reduced from £1,050,000 by returning to shareholders £4 per share, in 4 payments of £1 each. Net profits were £68,325 in 1906, £66,135 in 1907, £56,701 in 1908, £30,934 in 1909, £65,458 in 1910, £64,546 in 1911. Company has paid dividends regularly since organization, these ranging from 2 to 65%. Recent dividends have been as follows: 13s. in 1901, 11s. in 1902, 7s. in 1903, 7s. in 1904, 7s. in 1905, 7s. in 1906, 6s. in 1907, 6s. in 1908, 5s. in 1909, 6s. in 1910, 6s. in 1911. The company has a staff pension fund.

This company was formed to acquire the lease on the San Domingos copper and sulphur mine at Mertola, Portugal, just over the border of Spain, and in the same belt of pyrite deposits as the Rio Tinto, Tharsis and others. The mine had then been worked since 1858. The report for 1912 shows that 425,963 tons of pyrite was mined and that the shipments of raw and washed ore were 350,733 tons. No details are given as to the production of copper, or as to the nature of the ore mined and shipped. The accounts for 1912 show a profit of £85,665, out of which £20,000 has been placed to reserve and £64,810 distributed as dividend, being at the rate of 35%.

Lands are held by lease for a 50-year term, ending Oct., 1958. The property originally was opened and worked extensively by the Romans. Development is by several shafts, deepest level being at 300 meters from surface. A mineral zone of about 200' width, and proven length of 2,000',

carries lenses of cupriferous pyrite averaging slightly under 1% copper and about 50% sulphur, the principal values being in sulphur rather than in copper. With increasing depth copper values have decreased slowly but steadily.

Ore reserves were 5,250,000 long tons at the end of 1904, and were increased to 7,500,000 at the end of 1909. In 1911 overburden to the extent of 165,964 tons was removed at a cost of £7,711.

Ore is leached for copper values on the same general plan as at the Rio Tinto, and there are about 438,960 long tons of ore, containing about 1,500 long tons fine copper. Sulphur ore is shipped to British works for burning.

The company owns a railway to Pomarao, a tide-water port on the Rio Guadiana, where there is a shipping pier and tugs.

Ore shipments 1912, were 350,733 long tons, compared with 277,583 in 1911. Maximum production was 8,353,229 lbs. fine copper in 1901, and recent production has been as follows: 6,605,760 lbs. in 1904, 6,088,320 lbs. in 1905, 5,519,360 lbs. in 1906, 5,871,040 lbs. in 1907, 6,186,880 lbs. in 1908, 5,299,840 lbs. in 1909, 6,619,200 lbs. in 1910, 6,545,280 lbs. in 1911, 7,925,120 lbs. in 1912. Apparently the day of the San Domingos has passed as an important copper producer, but the property, which has a long and honorable record of production, is carefully managed and is made to yield good profits from its sulphur ores.

MAZE MINE.

JAPAN

Mine office: Terado, Nishi-Kambara, Echigo, Japan. Mine, opened A. D., 1688, has several small veins averaging 12" width, carrying chalcopyrite and pyrite frequently associated with sphalerite and galena, lying mainly in propylite. Ore yields 17 to 20% copper after careful selection.

McKECHNIE BROS.

ENGLAND

Widnes, Lancashire, Eng. Own an electrolytic refinery of about 10 short tons daily capacity, having three 75-kw. generators and 234 tanks, with multiple arrangement of electrodes.

MEDUORUDIANSK MINE.

RUSSIA

See Nijni-Tagilsk Mines & Works.

MELIK-ASARJANZ MINE.

RUSSIA

Office: Lermontovskaija 14, Tiflis, Trans-Caucasia. Mine office: Zange-shur, Elizabetopol, Russia. Property includes the Katarsky and Suninski mines and adjoining properties, near the Ugurchaiska mine. There are 3 shafts developing a number of veins, 3 to 7' thick in diabase. The veins carry chalcopyrite, bornite and covellite ore averaging about 15% copper. A system of 20 known fault fissures is also noted, cutting andesite and diabase, and carrying mainly chalcopyrite with occasional bornite ore, both auriferous and argentiferous, averaging about 7% copper. Workings are primitive, deepest being only about 130', at last accounts. Has hydro-electric power using turbine with power plant on canal, taking water from the Ochtchy Tschai river. Production is around 2,000,000 lbs. fine copper annually.

MELKEDALEN, LTD.

NORWAY

Idle. Office: 23 Leadenhall St., London, E. C., Eng. Mine office: Evenaes, Ofoten Fjord, Tromsö, Norway. Geo. Brooke Mee, chairman, and H. Higgs, directors; W. A. Stearns, sec.; J. D. Holman, cons. engr. Organized April 26, 1904, under laws of Great Britain, as a reconstruction of the Melkedalen Copper Mines, Ltd., capitalization £125,000, shares 10s. par; issued, £79,040.

Lands, 440 acres, freehold, carrying cupriferous pyrite of about 2%

copper tenor. Equipment includes a 150-ton mill, near Rosevanden. Presumably out of business.

MELROSE COPPER MINE.

NEW SOUTH WALES

Mine office: Condoblin, Cunningham Co., N. S. W., Aus. H. Ernest A. Miller, managing director and secretary, at last accounts. Organized Dec. 1, 1903, under laws of New South Wales, capitalization £12,000, shares £5 par.

Lands, 2 claims, 120 acres, held under 21-year lease from the crown, with option of renewal at 5s. royalty per acre yearly, also a 10-acre water right, in the Melrose and Condoblin districts. Property is well timbered, but water is scarce, nearest permanent water available being the Lachlan river, 26 miles south. The government railway is 29 miles distant. The mine was known first as the Boone West, and later as the Anaconda.

The property shows uptilted Silurian slates, often schistose, carrying fissure veins with 4 ore shoots, ranging from 6 to 20' in width, 30 to 50' in length, and proven on the Southern shoot for a depth of 280'. Development is by shafts of 95', 280', 65' and 100' and by a tunnel. Values are erratic, ranging from 2.5 up to 30% copper, with a general average for pay ore of 6 to 8% copper, 3 oz. silver and 2 dwts. gold per ton.

The mine has no machinery equipment, using horsepower and windlass. Property considered promising.

MENA; LORENZO.

CHILE

Office and mine: Cabildo, La Ligua, Aconcagua, Chile. Property includes 2 mines. The Mina Cata, at Los Quemados, 4 miles from the railway at Cabildo, has a vein in granite of 6 to 7' average width, with strike of N. 20° W. and dip of 78°. It has a paystreak 2' thick carrying cupriferous pyrite, reported by the owner to average 4% copper, 22% sulphur and 35% iron, with calcite gangue. Development is by tunnel. Ore, used largely for fluxing, is sold to various custom smelters in the district.

The Mina Santa Rosa, at Nipa, La Ligua, 925 meters above sea level, 8 miles from Cabildo, is developed by a long tunnel, driven on a vein 2 to 3' thick, carrying a 2 to 3" paystreak of massive ore of about 30% copper tenor as mined, dressed by hand to about 40% copper.

MERAKER BRUG; AKTIESELSKABET.

NORWAY

Office: Trondhjem, Norway. Mine at Røros, Norway. Company in process of reorganization June, 1913, and property idle. Property includes the Vigsnes and Stavanger, better known as the Meraker mines, which were among the principal copper producers of Norway, and were worked, 1865-94, by a Franco-Belgian company, yielding about 900,000 tons of cupriferous pyrite. Mines are extensively opened, deepest shaft being 2,410'. Ore carries 1.5 to 6%, with an average of about 2% copper, and 45 to 47% sulphur.

Equipment includes a hydro-electric power plant and there are about 10 miles of aerial trams connecting the mines with the concentrator.

MESSINA (TRANSVAAL) DEVELOPMENT CO., LTD. TRANSVAAL

Address: A. A. Kelsey, secretary, 3 Princess St., London, E. C., Eng. Mine office: Messina, Zoutpansberg, Transvaal. Arthur M. Grenfell, chairman; R. J. Frecheville, John S. P. Samborne and John P. Grenfell, directors; Chas. Stuart, chairman local board; J. M. Calderwood, cons. engr.; A. Woodburn, mine mgr.; T. Nicholls, smelter supt.

Organized Jan. 30, 1905, under laws of Great Britain, capitalization originally £110,000, increased Jan., 1908, to £200,000, and again increased July, 1911, to £250,000, shares 5s. par; issued, £165,451.

Lands, 22,432 acres, including 1,200 claims on the Farm Berkenrode, held under a 99-year lease from the Transvaal government, and 3 freehold

farms having a total area of about 14,000 acres, to which the farm Vogel-sang No. 1423, 6,646 acres, adjoining the farm Berkenrode, was added 1908. Former disputes over titles with the Oceana Consolidated Co., Ltd., were settled satisfactorily. Lands, about 6 miles from the Limpopo river, and about 130 miles north of Pietersburg, carry some timber fit for mining and building purposes, with water available at fairly shallow depth.

The Messina mine shows extensive ancient workings with shallow shafts and opencuts and scoria from old smelting operations extending for a distance of more than 1,000' along the course of the lode.

The country rock is granite, with a mineral zone of about 1,300' width, carrying 5 parallel veins, traceable for about 5 miles on the company's lands. There are 3 lenticular cupriferous deposits, known as the North, Middle and Bonanza lodes, and a little work has been done also on the South vein, which has been proven for about 2,400' length. The North lode is up to 5' in width, and the Middle lode carries chalcocite and bornite. The veins carry oxidized ores for about 100' depth, succeeded by secondary ores, mainly chalcocite, with considerable quantities of bornite and a little chalcopryite, the average grade of ore being exceedingly high.

The mine is opened by a 3-compartment main working shaft, 700' deep, being deepened to 1,000' and by 2 development shafts. The ore is mined by the slicing system, a modification of the caving plan, with 9 levels opened, the bottom level at 900' showing, in No. 5 shaft, an orebody 77' wide, of chalcocite, giving average assays of 14% copper. In Aug., 1913, No. 5 shaft was 824' deep and development work, aggregating 362', showed the Bonanza lode to be 20' wide, averaging 7.9% copper on the 8th level and to show 44' of 8% copper ore on the 9th level. The mine has about 5 miles of workings and ore reserves were estimated, June 30, 1912, as equivalent to 170,000 long tons of copper, with 330,000 tons of probable ore additional. The figures of ore reserves are conservative and, despite the exceedingly high average assay tenor, the official estimates of values are considered reliable.

Power is furnished by a Tangye suction gas producer, retorting charcoal, which is the cheapest fuel available. Equipment includes a double hoist, a new Robey hoist at No. 4 shaft, and a 3-drill air compressor, supplemented by a 10-drill Riedler air compressor.

The mine has a number of good buildings, including necessary shops, engine houses and dwellings for officials. Wood and coal are scarce, but a coal seam of workable quality has been opened in a coal-bearing area, held under option, about 25 miles S. W. of the mines.

The mill, originally of 50-ton capacity, increased 1909, to 65 long tons daily, is equipped with a Blake crusher, crushing rolls, revolving trommels having water sprays, Hartz jigs, 2 Wilfley tables and classifiers. Wash water is taken from the mine and a well, and water is stored in reservoirs. Concentrates were formerly of phenomenally high grade, averaging 60 to 65% copper, with rich middlings and slimes accumulated for future treatment. A new concentrator of 250 tons daily capacity was in the course of erection, 1913. It has Huntington mill and vanners, as well as a complete general equipment.

A smelting plant, with 2 reverberatory furnaces, each $11\frac{1}{2} \times 23'$, has been erected and is now in operation, smelting mill middlings carrying 10% copper and producing 76 tons of 51% matte in August with one furnace.

The construction of a railway was begun 1912, by the Union Government of South Africa, and will connect the mines with Bantolier Kop, Oct., 1913. The work is done under an agreement entered into between the Government and the Messina Co., whereby the latter guarantees for a period of

10 years any loss resulting in the operation of the railway, the amount payable in any 1 year not to exceed $4\frac{1}{2}\%$ on £426,831, the estimated cost of the line and rolling stock. The distance between the mines and Bandolier Kop is about 100 miles and the line when completed will give direct communication with Delagoa bay and Johannesburg.

Production was begun Jan., 1906, and to end of June, 1911, totalled 65,788 tons of ore of about 12% copper tenor. Production for fiscal year ended June, 1912, was 10,347 tons of about 11% copper tenor. Production for the 3 months ending June 30, 1913, was 1,218,067 lbs. copper.

The mill handled 5,960 tons and produced 32.5% copper concentrate. Concentrates are sent to Swansea for reduction. The property is one of proven merit and the management is excellent in every respect.

MESSINA PRIMROSE COPPER COR'N, LTD. SOUTH AUSTRALIA

Secretary's address: S. J. Hancock, 70 Broad St. Avenue, London, E. C., Eng. C. Neilsen and J. S. G. Campbell, directors. Organized June 10, 1911, capitalization £225,000, shares £1 par; issued, £171,982.

Property, known as the Wagendrift farm, 2,046 acres, about 60 miles N. E. of Pietersburg, in the Koodoes valley, has been abandoned and present holdings apparently consist of 680 acres of copper-bearing lands and a 10-acre lease with smelter concession at Beltana in South Australia.

METALS DEVELOPMENT SYNDICATE, LTD. ENGLAND

Secretary's address: F. A. Crew, 20 Copthall Ave., London, E. C., Eng. C. A. Moreing, chairman; W. J. Loring, T. W. Wellsted and E. A. Loring, directors. Organized 1912, capitalization £10,000, shares 5s. par; issued, 7,000 shares. Company has an option on the Treveddoe tin and copper mine at Warleggan, Bodmin, Cornwall.

MICULICICH y VALENTINE.

PERU

Mine office: San Tadeo, Yauli, Junín, Peru. Property is the Mina Gertrudis, owned jointly with the Morococha Mining Co., and described under title of Mina Gertrudis.

MIED CORPORATION.

RUSSIA

Address: Krukoff Channel 14, St. Petersburg, Russia. Capitalization £15,000. The shares are held by the copper-producing and smelting companies in proportion to their importance, the shareholders agreeing to sell only through the Mied Corporation and its sales agents, the Vogau Co.

The Mied (Copper) Corporation is a share company that controls over 90% of the Russian copper production. The sales agent, the Vogau Co., sells only by consent of and at the price fixed by the Mied Corporation, and contracts have been made with most of the copper factories of Russia at prices proportionate to those of the London market. The trust has been instrumental in having a duty of £40 per ton imposed on copper imports, thus barring foreign copper from the Russian market.

The corporation divides the Russian copper industry into 4 classes: (a) Those composing the Mied Corporation and being shareholders thereof. This group produced 30,758,269 lbs. fine copper in 1912, or 41.8% of the total Russian production.

(b) Producers and factories selling exclusively to the Mied Corporation, a group which in 1912 produced 20,827,844 lbs. copper, or 28.2% of the total production of the country.

(c) Independent producers who sell by ordinary agreement to both the Mied Corporation and to outsiders, a group producing 17,627,910 lbs. copper in 1912, or 23.8% of the total Russian production.

(d) Independent anti-trust producers dealing only with outsiders and producing 4,597,401 lbs. copper, or 6.2% of the Russian output in 1912.

The total Russian production for 1912 was 73,911,429 lbs., or 17,430,336

lbs. more than in 1911. The 1913 output is estimated at 77,650,000 lbs. copper.

MIEDNORODIANSK MINE.

RUSSIA

See Rudianski Mines.

MIEDZIANKA MINE.

AUSTRIA

Laszczynski Brothers, owners, Kielce-Checiny, Galicia, Austria. The property is an old mine, about 55 miles north of Cracow, abandoned for nearly a century until taken over by the present owners. Lands show a belt of cupriferous limestone about 150' wide and traceable for $1\frac{1}{4}$ miles, reported to carry copper ore in streaks of $\frac{1}{2}$ to 1" thickness only, ore being mainly chalcocite, with some azurite and malachite, ranging 15 to 45% in copper tenor, having a gangue of calc spar and quartz. The mine has been opened to a depth of 150'.

The mine output is hand-picked, crushed by rolls and molded into blocks, with 5% of clay for a binder, bricks being dried by waste heat from the furnace and partially roasted in a kiln.

The experimental reduction plant is of small capacity only. Roasted ore is crushed fine and leached in lead-lined tanks with spent liquor from the electrolytic baths containing about 5% of free sulphuric acid, giving as a product a liquor containing about 5% copper and 1% free acid. The pulp is put through a filter press, the solution going to electrolytic tanks having lead plate anodes, in cloth bags, and thin sheet-copper cathodes. Current is 1,000 amperes, at 2.5 volts, giving a current density of 1 ampere per square decimeter of cathode surface. Deposition of copper is said to be about 1.1 gram per ampere-hour, nearly equal to the theoretical deposit, and power consumed, per kilogram of copper deposited, is 2.48-kw.-hours. Liquor is exhausted in about 36 hours, when it is returned to the extraction baths for treatment of fresh ore. Cathodes remain in the bath for about 1 month, when the deposit becomes 1 to $1\frac{1}{4}$ " thick. Product is said to be of greater purity than ordinary electrolytic copper. The process is simple, and requires but a single skilled workman for its operation. Compare with process used at the Bullwhacker and the Butte-Duluth mines of Butte, Mont.

MIHARA MINE.

JAPAN

Owned by Utsonomiya Mining Co.

MINERALS SEPARATION AND DE BAVAY'S PROCESSES.

AUSTRALIA PROPRIETARY, LTD.

AUSTRALIA

Secretaries and offices: E. H. Shackell, 360 Collins St., Melbourne, Aus., and A. O. Williams, 62 London Wall, London, E. C., Eng. W. L. Baillieu, chairman, and A. E. Bright, H. H. Greenway, M. Cohen, J. L. Wharton, directors. Organized June, 1912, capitalization £300,000, shares £1 par; issued, 265,000 shares. Initial dividend of $2\frac{1}{2}\%$ was paid Dec., 1912.

Company was formed to acquire all patents for the processes and apparatus owned and used in Australia and New Zealand, by the Minerals Separation, Ltd., the De Bavay's Sulphide Process Co., Ltd., the Potters Sulphide Ore Treatment, Ltd., and the Amalgamated Zinc, Ltd., and to exploit and investigate flotation processes and patents as may offer, and last but not least, to avoid threatened litigation between the companies thus amalgamated.

MINERALS SEPARATION, LTD.

ENGLAND

Secretary's address: A. O. Williams, 62 London Wall, London, Eng. J. Ballot, chairman and managing director; W. W. Webster, H. A. Krohn, J. H. Curle, S. Gregory and F. L. Gibbs, directors; W. Broadbridge, chief engr.; Sulman & Picard, cons. metallurgists. Organized Dec. 31, 1903, capitalization £15,000, increased Oct., 1904, to £20,000 and again increased Dec., 1905, to £50,000, shares £1 par.

Company owns certain patents for flotation processes and apparatus for the recovery of concentrates from copper, silver, lead and zinc ores, including patents formerly held by the Cattermole Ore Concentration Synd., Ltd. It has sold the rights for Australia and New Zealand to the Minerals Separation and De Bavay's Processes Australia Proprietary, Ltd., which is controlled by the Minerals Separation, Ltd., through ownership of 145,750 shares out of a total of 265,000 shares issued.

MINING EXPLORATION CO.

ARGENTINA

C. S. Nicholson, receiver, 31 Copthall Ave., London, E. C., Eng. Liquidated by court order of Jan. 16, 1912. Former property the Victoria mine and other copper properties, with concession for 45 sq. miles in the Andes, of the Argentine Republic, on the west slope near the Chilean border. Holdings reported transferred 1911, to the New Transandine Synd., Ltd., but no details concerning the new company are procurable. Fully described Vol. X.

MINING & SMELTING CO., LTD.

WALES

Secretary's address: W. Cooling, 10 St. Helen's Place, London, E. C., Eng. Organized Oct., 1911, capitalization £22,900 in 12,000 preferred and 10,000 common shares, par value £1, and 18,000 shares of a par value of 1s.

Property, a copper mine at Drws-y-Coed, Talysarn, Carnarvonshire, Wales, formerly owned by the Complex Ore Co., Ltd., and held under lease by present company.

MINNIE MINE.

CHILE

Mine office: Higuera, La Serena, Coquimbo, Chile. T. H. Everitt, Juan Bade and J. Aldai, owners and managers. Lands, 1 pertenencia, 5 hectares, about 13 miles north of Higuera, showing a vein of 10' width at surface, producing carbonate ore of about 10% average tenor. Mine is opened by 2 adit levels, and ore is sold to Sociedad Minera San Juan.

MITSU BISHI GOSHI-KWAISHA.

JAPAN

Office: Yaesucho Itchome, Kojimachi-ku, Tokio, Japan. Offices and agencies: Yokohama, Nagoya, Handa, Osaka, Kobe, Moji, Wakamatsu, Karatsu, Nagasaki, Otaru, Muroran, Hakodate and Tsuruga, in Japan; Shanghai, Hankow, Peking, Chinking and Hongkong, in China; Singapore, in India; Manila, in the Philippines; London, England, and Glasgow, Scotland. Baron Hisaya Iwasaki, pres.; Baron Koyata Iwasaki, vice-pres.; Kusunyuta Kimura, gen. mgr.; Itsutaro Morikawa, asst. gen. mgr.; Shinji Harada, mgr. metal mg. dept.; Kingo Nambu, mgr. coal mg. dept.; Sadaye Eguchi, mgr. business dept.; Hidemi Maruta, mgr. shipbuilding and engineering dept.; Kumpei Mimura, mgr. banking dept. Organized 1893, capitalization 15,000,000 yen.

The Mitsu Bishi is the foremost private enterprise in Japan, and a worthy memorial to its founder, the late Yataro Iwasaki. Its interests are varied, but are chiefly in mining, shipbuilding and banking.

The company is an important producer of gold, silver, copper and coal, possessing 12 metal mines and 7 coal mines which, in 1912, yielded 1,630 kgs. gold, 24,200 kgs. silver, 23,448,000 lbs. copper, and 2,665,000 metric tons of coal. Mitsu Bishi copper is marketed in 2 forms, as electrolytic ingots and as Arakawa slabs, both branded with 3 diamonds, to insure identification, as it is unsurpassed in purity and electrical conductivity. Practically the entire output is sold in the London market through its agents, Messrs. H. J. Stockton & Co.

The Osaruzawa mines are at the village of Hanawa, Kazuno district, Akita, Japan. Kinjiro Shimamura, supt.; T. Kawamura, asst. supt. Lands, about 1,427 acres. Mines are very ancient, having been opened in the eighth century, but were worked for gold only until about 1650, when cop-

per ores were developed. Ore is chalcocite, chalcopyrite, bornite and a little native copper, associated with pyrite and small quantities of sphalerite, galena and hematite. Occasionally native gold is found mixed with the copper ores and in a quartz fahlband, gold values occurring mainly in the upper workings.

The ore occurs in a complicated system of interlacing fissure veins varying from less than 1' to over 10' in thickness. Their dip is 15°, 45°, 75°, and also in opposite directions. The average width is 3', and the copper content 3 to 4%. Most of the ore is also high in iron pyrite. The veins, which are very persistent in strike, and workable to an average depth of 500', traverse Tertiary shales and tuffs, with intrusive augite-andesite and liparite. Development is by 8 working shafts and 12 main tunnels, with upwards of 17 miles of workings. Equipment includes electrical installations aggregating 1,140 h. p. Forces average about 2,000 persons. Production is at the rate of 70,000 tons ore monthly.

The reduction plant has two 40-ton water-jacket blast furnaces, with a 250-h. p. electric plant, turning out blister copper of 98% tenor, sent to the Osaka Electrolytic refinery. A new ore-dressing house is in the course of erection. During 1,200 years of operation, these mines have produced immense quantities of copper, gold and silver. Recent production is as follows:

Year.	Gold, kgs.	Silver, kgs.	Copper, lbs.
1908.....	16.8	606.7	1,284,269
1909.....	9.6	973.5	1,574,645
1910.....	12.9	1,192.7	2,236,382
1911.....	10.3	966.7	2,005,368
1912.....	11.2	1,310.5	2,188,336

The Arakawa mine is at Arakawa-mura, Sempoku district, Akita, Japan. Shokichi Namura, gen. supt. Lands are about 2,100 acres. Mine is connected with Sakai station on the railway by a 7-mile tram.

Country rocks, Tertiary volcanic sediments and crystalline rock, include augnite-andesite, liparite and propylite, carrying 10 parallel veins in propylite, with strike approximately N. E. and S. W., and workable for 1,000 to 4,000' along their course. Ore consists of chalcopyrite and quartz with a little pyrite, galena and blende. Oxidized ores, mixed with sulphides, averaging about 2 copper, extend down to 500' below surface. The mine is developed by 5 shafts of 300 to 600', and numerous tunnels, deepest workings being at 800' in the lower tunnel. Equipment includes 5 power houses, with aggregate of 4,000 h. p. About 1,900 persons are employed. Ore production is around 5,000 tons per month. Output, including Hisaichi branch, has been as follows:

Year.	Silver, kgs.	Copper, tons.
1908.....	832.1	1,445,854
1909.....	1,341.4	2,027,259
1910.....	1,520.7	2,007,142
1911.....	1,403.2	2,261,227
1912.....	1,369.6	2,030,286

The Hisaichi mine, area 909 acres, at Nakagawa village, about 5 miles S. E. of the Arakawa, is geologically similar to the Arakawa. There are 7 veins, the largest, known as the Ugaisawa, of about 24' average width, carrying about 8' of payable ore, and occasionally branching into several smaller veins. The other workable veins range 5 to 7' in width. The ore averages 3% copper present as chalcopyrite, with oxidized ores, hematite and lead zinc sulphides, and a little gold and silver. There is a 500' shaft. Equipment includes water and electric power installations, and a 50-ton

smelter. Forces average 1,200 hands, producing an output of 4,500 tons of ore monthly, of which 1,200 tons are smelted locally.

The Omodani mine, area 350 acres, is at Kami-Anana village, Ono district, Fukiu prefecture, Japan, 50 miles south of railway at Fukui, and 27 from town of Ono-Machi. This property, opened A. D., 1350, has numerous small veins, none of which exceed 3' in width, impregnating sandstone and altered quartz porphyry. The ores carry bornite, chalcopyrite, spalerite and galena, all argentiferous and having some native silver. Four larger veins, up to 10' in width, showing low-grade ore, are also worked. Ores average about 6% copper and 72 oz. silver per ton. The mine has a shaft, with 5 levels, the longest 12,110', and all aggregating 58,380' in length, with 23,750' of track. Hydro-electric power is used. The working force is around 700 men and the monthly output 1,154 tons of ore, making 23 tons of 97.5% copper. Output for past 5 years is as follows:

Year.	Gold, kgs.	Silver, kgs.	Copper, met. tons.
1908.....	0.225	1,060	227.1
1909.....	1.110	985	201.1
1910.....	1.553	1,256	255.2
1911.....	1.646	1,163	260.6
1912.....	1.346	1,026	239.5

The Ikuno mines, area 10,736 acres, are at Ikuno, Hyogo, Japan. Akira Yamada, general manager. The principal mines of this group are the Tasei, Kanagase, Akenobe and Kasei. There are 4 lesser mines. The Tasei mine has a 14' main vein with numerous branches in quartz porphyry, altered andesite and tertiary tuffs, the ores carrying native gold and silver together with chalcopyrite, galena, zinc-blende and pyrite. This vein is notable for its silver contents and has been the mainstay of the mine for centuries, giving it the name of the silver mine of Ikuno.

The Kanagase mine, near the Tasei, has many veins in quartz trachite, 3 of them being workable. Property is traversed by several basalt and andesite dikes with fault dislocation of the veins along the dikes. The chief copper vein is 8 to 10' in width, runs N.-S., dips 60 to 80° E. and is 10,000' long, carrying native copper, bornite, chalcopyrite and tetrahedrite. Two other veins now being worked are 3 to 9' thick, nearly vertical, minable for 2,000' and hold argentite, sphalerite, galena, ruby-silver and stibnite besides copper sulphides.

The Akenobe mine has numerous copper and tin-bearing veins in Paleozoic slate, scattered along the Akenobe river. Eleven veins are worked, the widths varying from 3 to 40', ores carrying chalcopyrite, bornite cassiterite, wolframite, and blende as by-products. The extent and richness of the tin deposit has been already proven and the output is now of considerable importance.

The Kasei mine shows hornblende gneiss, cut by rhyolite and propylite dikes with fissure veins carrying silver sulphides associated with chalcopyrite and native silver.

Equipment includes steam, water and electric power plant. The copper is shipped in slabs carrying 96.83% copper, .0072% gold and .4742% silver. Output for past 5 years has been as follows:

	Gold, kgs.	Silver, kgs.	Copper, tons.	Tin, tons.
1908.....	132.1	6,742	1,166.6	
1909.....	291.2	7,604	1,280.6	
1910.....	207.3	7,750	1,403.6	219.4
1911.....	172.5	7,396	1,488.6	266.6
1912.....	130.4	8,045	1,636.5	378.2

The Kanayama mine, a dependent of the Ikuna property, has 369 acres on the island of Shikoku, across the Inland sea, in the Kita district, an hour's run by steamer from Nagahama. Property shows interbedded lens of cupriferous pyrite, $\frac{1}{2}$ to 10' thick in Archean schists. The bed is flat, workable for 3,000' and yields ore averaging 3.3% copper, 40% sulphur, 950 tons a month being produced and sent to Ikuno.

The Yoshioka mine, area 1,184 acres, is at Fukiyamachi, a small town in Kawakami district, Okayama prefecture, 33 miles from Tatai on the railway. Yaichiro Wakabayashi, manager. Property shows slates, sandstones and phylites cut by porphyrite and quartz porphyry. The ore deposit is divided in two, one part in the sedimentary beds, increasing in richness with depth, the other an impregnation in metamorphic slates of the igneous contact zone; the former shows veins of erratic width netting the rocks. The ore is chiefly chalcopyrite with accessory pyrite, arseno-pyrite, pyrrhotite, galena and blende with a quartz gangue, and averages 3 to 8% copper. The mine has a 360' shaft with 9 levels and a 375' blind shaft. Total development amounts to about 28 miles, the mine employing an average of 1,250 persons and yielding 7,500 tons of ore monthly. The output for the past 5 years is as follows:

	Gold, kgs.	Silver, kgs.	Copper, tons.
1908.....	5.251	1,707.2	822.7
1909.....	3.808	2,253.3	852.6
1910.....	3.933	2,102.6	778.8
1911.....	4.721	1,785.8	766.9
1912.....	4.747	2,090.8	746.6

The Makamine mine, area 1,070 acres, in 4 lots, is at Kitakata village, Higashi-Usuki district, Miyazaki, Japan. Mine is far away from railway lines, but in a well-traveled region. It is accessible by steamer up the Gokase river to Tomi. Country rock is slate with interbedded sandstone and a capping of lava from the Aso volcano. These rocks are cut by veins of small size carrying lenticular ore shoots of cupriferous pyrite, averaging 5% copper, the ore shading into pyrite, pyrrhotite and lievrite. There are 11 main veins whose orebodies are from 10 to 20' wide, though averaging but 1 to 7' and are 30 to 300' long. Development is by tunnels at 50 to 60' intervals with inclined winzes of 310' and 1,000' and a vertical 240' winze. Workings aggregate 23,300'. Equipment is hydro-electric and about 530 persons are employed. Production for the past 5 years is as follows:

	Gold, kgs.	Silver, kgs.	Copper, tons.
1908.....	10.4	138.8	545.59
1909.....	10.5	158.2	516.50
1910.....	9.1	113.0	480.53
1911.....	15.2	136.3	711.46
1912.....	17.5	202.9	675.97

The Osaka metallurgical works are located at Shin-Kawasaki Machi, Kita-ku, Osaka, adjoining the Imperial mint. The works cover 12 acres and employ about 200 hands. The plant has 15 reverberatory furnaces turning out anodes of 97 to 99% purity for conversion into electrolytic copper, cathodes assaying 99.89% copper, 0.0037% silver, 0.014% lead, 0.010% arsenic and a minute trace of sulphur. Gold and silver slimes yielded by the electrolytic separation are washed and dried preparatory to roasting in a small muffle furnace. They are then leached with the waste solution of the refinery to dispose of the remaining copper, the residue being mixed with lead and cupelled.

Production by all mines of the company since 1906 has been as follows:

Year.	Copper, lbs.	Silver, kgs.	Gold, kgs.
1906.....	9,087,860	15,506	567
1907.....	13,103,235	19,084	578
1908.....	10,891,300	17,105	825
1909.....	14,228,075	18,955	1,886
1910.....	15,670,075	20,130	1,741
1911.....	19,758,855	24,568	1,744
1912.....	21,428,730	23,414	1,666

The Mitsu Bishi is one of the 4 large copper mining companies operating in Japan and, like the others, is exceptionally progressive. Success has not been won by the possession of mines of exceptional value, though the company has some excellent properties, but rather by the utilization of the most modern methods and appliances in mining and metallurgy, directed by the best technical skill available.

MITSUI MINING CO.

JAPAN

Mine office: Funatsu, Gifu, Tokio, Japan. C. Tanikawa, superintendent. This is an extensive trading firm and is a producer of coal, coke, sulphur, copper, pig-lead and refined bismuth. The properties are well equipped and handled with technical skill.

The Kamioka mine is primarily a silver-lead mine, but a little copper is secured as a byproduct. Production 1911, was 71,224 lbs. fine copper, 6,751,-334 lbs. lead and 39,714 oz. silver. The mine employs 615 workmen and has a 568-h. p. steam power plant and 41-kw. electric plant.

MITTERBERGER KUPFER-AKTIENGESSELLSCHAFT. AUSTRIA

Office: Schulhof 6, Vienna, Austria. Mine office: Mühlbach bei Bischofshofen, Salzburg, Austria. Employs 200 men. Arthur Krupp, pres.; Ludwig Neurath, vice-pres.; preceding officers, Dr. Horace Ritter von Landau, Arthur von Escher, Dr. Paul Mann and Julius Stern, directors.

Organized Oct., 1908, under laws of Austria as successor of Mitterberger Kupfergewerkschaft, capitalization 1,400,000 crowns, increased, Dec., 1909, to 2,100,000 crowns, shares 200 crowns par, fully paid. Fiscal year ends June 30.

Lands, 10 mining claims, 800 hectares, 15 miles from Bischofshofen, and about midway between Salzburg and Innsbruck, in the Austrian Tyrol. The property shows Silurian and Cambrian schists, limestone and dolomite, carrying 6 parallel veins, the principal veins, known as the Josephi, Johanni and Marien, being of 6 to 9' average width, with E.-W. strike and average dip of 68°, traceable 4,000 meters. These veins carry auriferous, argentiferous and slightly nickeliferous chalcopyrite, associated with pyrrhotite, arsenopyrite and siderite, with quartz gangue. The veins do not carry continuous values, there being only 1 payable lode in any given cross-section, ore shoots switching from 1 vein to another, at intervals. The veins carry high values in stringers of 1 to 30" width, with balance payable throughout the vein at points mineralized, ore being reported to average about 3% copper. The Mitterberger group, discovered and opened 1827, includes the Einöden, Buchberg and Heidberg mines, and has extensive underground workings, with shafts of 268, 182 and 25 meters depth, and tunnels of 1,666, 2,343, 3,640, 3,220, 570, 300, 250, 620, 180 and 450 meters length, the mines as a whole having upwards of 8 miles of workings.

Equipment includes 2 electric hoists, good for 400 meters depth each, and 2 air compressors, of 32 drills aggregate capacity, with 38 air drills and 20 electric drills, 5 of the latter being of Temple and 15 of Siemens-Schukert make. Installations include electric plants of 530 h. p., water plants of 770 h. p., and gasoline plants of 225 h. p., with 255 h. p. used at the mine, 225

h. p. at the mill and 430 h. p. at the smelter. There are 21 mine buildings and 3 sawmills.

There are several small concentrators at the portals of different tunnels, at Ausserfelden, near the smelter, the main concentrator having 2 Blake crushers, 5 sets of rolls, 24 Hartz jigs, 13 Ferrari tables, 4 Ullrich electromagnetic separators, a Wetherill magnetic separation plant and a 45-ton Elmore vacuum oil flotation plant.

The smelter, at Ausserfelden, near the main mill, and 4 miles from the mines, receiving ore by wagon, is of 50 metric tons daily capacity, equipment including 8 Stoffel calciners, two 9-ton reverberatory furnaces, and 20-ton and 30-ton water-jacket blast furnaces. First-fusion product is a 40% matte, which is refined to blister copper of 98.6% average tenor in 8 one-ton Manhés converters. The smelter does custom work, and in connection there is a small refinery. Property considered valuable, and management good.

MIZUSAWA MINE.

JAPAN

See Furukawa Mining Co.

MONA & PARYS MINES, LTD.

WALES

Secretary's address: R. Bridson, Anglesey, Wales. Mine office: Mona, Amlwch, Anglesey, Wales. G. H. Cartland, T. Fanning Evans and R. W. Rücker, directors; Midland Trust Co., Ltd., Birmingham, trustee for debenture holders. Organized Jan. 13, 1899, under laws of Great Britain, with capitalization £75,000, shares £1 par; issued £58,000. Debentures £15,000 first-mortgage bonds at 6%, and £10,000 second-mortgage bonds at 7%, with interest in arrears.

Company owns the Mona, Parys Mountain and Morfa Du mines, formerly the most important copper producers of Wales. Property, 1,067 acres, including old copper mines, ochre mines and color-works plant at Amlwch, tramways and improved water frontage. Mines were worked in this district by the Romans. The Parys mine was opened 1768, and made 3,000 long tons of copper in 1784, at that time being perhaps the largest copper producer of the world. Present production is only 25 to 50 tons fine copper yearly, secured, as precipitate, by leaching mine-waters from the old and idle workings.

MONS CUPRI, LTD.

WESTERN AUSTRALIA

Secretary's address: H. Bacon, 62 London Wall, London, E. C., Eng. Mine office: Whim Creek, Pilbarra, Western Australia. G. B. Elkington, chairman; E. Anderson, W. S. Wilson, H. Pinckney and J. Conchie, directors; H. R. Sleeman, cons. engr. Organized Nov. 29, 1910, capitalization £150,000, shares £1 par; issued £103,807.

Lands, 130 acres leasehold, about 3 miles S. W. of the Whim Well Copper Mines, developed by several shallow shafts and opencuts. Ores average about 5% copper.

Company was planning 1913, a 100-ton concentrator and the erection of a 5-mile tramway to connect with the Whim Well tram.

MONTACUTE GOLD & COPPER MG. CO.

SOUTH AUSTRALIA

Office: Adelaide, So. Australia. R. H. Williams, manager. Property is a copper-gold prospect, on Sixth creek, about 10 miles from Adelaide, developed by several shallow shafts and tunnels, showing ferruginous slate, quartzite and quartz and iron veins carrying small patches of copper sulphides and iron pyrites. A 110' shaft discloses high-grade copper ore in 2 parallel veins, picked samples assaying up to 12% copper and \$8 gold per ton.

Property considered promising, but company is out of funds and idle, at last accounts.

MONTE RUBIO MINES.**SPAIN**

Owned by Sociedad Colectiva C. y J. Sundheim, at Puebla de Guzmán, Huelva, Spain.

MONTECATINI; SOC. ANONIMA DELLE MINIERE DI.**ITALY**

Office: 49 Piazza Santa Apostoli, Rome, Italy. Mine offices: Boccheggiano and Massa Marittima, Tuscany, Italy. Works office: Leghorn, Tuscany, Italy. Paolo Marengo, general manager. Organized 1888, under laws of Italy, capitalization 5,000,000 lire, increased 1906, to 6,500,000 lire, shares 100 lire par. Paid dividends, 1899-1902, of 82 lire per share.

Lands include the Montecatini, Boccheggiano, Capanne Vecchie, Fenice Massetana and Val di Nievole mines, all very ancient properties, worked successively by the Etruscans, Romans, Goths and Italians. Principal properties are about 20 miles from Massa Marittima, the nearest rail station, on the Mediterranean railway.

The Boccheggiano mine, which is the principal producer, has a fault vein between micaceous Permian shales and Eocene limestone, of 13 to 16' width, with dip of about 50° E., carrying paystreaks, along the hanging wall, of chalcopyrite, associated with pyrite and occasional hematite, with quartz gangue. The ore in the southern end of the mine is mainly zinciferous, slightly plumbiferous, and carries about 0.05% tin. There also are occasional veinlets of highly argentiferous tetrahedrite. Development has been difficult on account of the heavy inflow of thermal waters at a temperature of 105° F. The reduction plant of the Boccheggiano is at Montieri, Tuscany, Italy.

The Montecatini mine proper has a brecciated red porphyry, carrying occasional native copper and some massive sulphides, but mainly disseminated chalcopyrite, bornite and chalcocite, ores averaging about 3.5% copper as mined. The Montecatini has steam power and a concentrator with 5 crushers.

The Capanne Vecchie and Poggio Bindo mines are ancient properties, reopened 1846, since which time they have been small but steady producers. The principal vein is 6" to 50' in width, ore being mainly chalcopyrite, which is assorted into first-grade smelting ore of about 10% copper tenor, and second-grade ore carrying about 3% copper only, which is heap-roasted and leached. There is a mill.

The Fenice Massetana mine, also at Massa Marittima, shows orebodies of 6" to 65' width, apparently lenticular, carrying chalcopyrite associated with pyrite, in a quartz gangue, with occasional sulphides of higher grade. The high-grade ore, averaging 10% in tenor, is heap-roasted at the mine and smelted at Leghorn, and second-grade ore, averaging about 3% copper, is heap-roasted and leached at the mine. Equipment includes a concentrator.

The Val di Nievole mine carries low-grade ores that can be worked profitably only when copper prices are high, and this property has been idle for several years.

The smelter at Leghorn has 4 reverberatory furnaces and a converter plant. In connection with the smelter is a sulphuric acid plant for the utilization of the sulphur fumes, the low-grade ores of 3.5% copper tenor averaging about 40% sulphur contents.

Property is one of the best known and most productive mines of Italy.

MORADO; SOCIEDAD ESPLORADORA DEL.**CHILE**

Office and mine: Freirina, Atacama, Chile. Organized Dec. 22, 1906, under laws of Chile, capitalization 500,000 pesos, shares 20 pesos par. Property is Las Arenillas mine, in an undeveloped district, said to have been opened 1860, but upon which very little work was done until taken over by

the present company. Has a machinery plant and was planning to build a small matting furnace, at last accounts.

MORFA COPPER WORKS.

WALES

Works office: Swansea, Glamorganshire, Wales. Property is a zinc and copper smelter at Middle Bank and at Upper Bank, Landore, near Swansea. Is controlled and operated by Henry R. Merton & Co. and the Metallurgische Gesellschaft A. G.

MOROCHOA MINING CO.

PERU

Office: Morococha, Junin, Peru. Incorporated 1908, under laws of New Jersey, capitalization \$10,000,000. Company is a subsidiary, formed by the New York interests of the Cerro de Pasco Co., prior to the settlement of litigation with the Socavon del Cerro de Pasco.

Property, the Gertrudis, San Francisco and San Miguel mines and a one-half interest in the Natividad mine, which is owned jointly with the Backus & Johnston Co.

The Mina Gertrudis, opened 1897, is on the Cerro San Marcello, shortly west of Lake Morococha. Property shows 3 limestone beds having ore impregnations following the bedding planes, and a vein with strike of N. 51° E. and nearly vertical dip of about 2 meters average width, with a paystreak of 60 cm. to 1 meter, carrying gray copper and chalcopryrite averaging about 14% copper and 1,000 grams silver per metric ton, balance of vein carrying about 5% copper and 300 grams silver per metric ton. The mine has a 12-meter shaft, but is developed mainly by a tunnel, just above the level of Lake Morococha, mining through winzes sunk from short cross-cuts in the hanging. Ore is hand-cobbed at the portal of the tunnel.

The Natividad mine is opened to about 300 meters depth, developing a vein about 4' wide, carrying ore averaging about 14% copper and 14 to 70 oz. silver per ton. A new tunnel, planned to be 750 meters long, is being driven under the old workings.

The Mina San Miguel is developed by the Copaycocha and Vulcano tunnels, lower of about 500 meters length, and ore is mainly enargite, with some tetrahedrite and tennantite, associated with pyrite. Mine was opened 1894, and in 10 years produced from ore averaging about 20% copper and 333 grams silver per metric ton, 6,476,400 kgs. fine copper and 10,794 kgs. fine silver.

The San Francisco is being opened by a 4,000' tunnel, about one-half completed, Sept., 1913, known as the Carlos Reynaldo adit.

Production is gradually increasing, and early 1913, was about 7,000 tons of ore monthly, which was being shipped to the Cerro de Pasco smelter.

Transportation facilities are poor and a railway is badly needed, which if given, will result in a material increase in production. The property is one of considerable promise and great potential value.

MOROTAKA YAKATA.

JAPAN

Owns the Kinjodani mine in Yehime, Japan, employing 88 persons and producing 272 tons of ore in 1911, valued at \$6,464.

MOTALE COPPER DEVELOPMENT SYND., LTD.

TRANSVAAL

In liquidation. Office: 43 Commercial Exchange, Johannesburg, S. A. Operated 1911, with poor success, near Motale, North Transvaal, and has allowed all options, held in that field, to lapse.

MOUNT BABINDA MINE.

QUEENSLAND

A copper prospect, in the Heberton field, Queensland, developed by 36' shaft, showing a 6" seam of argentiferous ore, said to average 25% copper.

MOUNT BALFOUR COPPER MINES, N. L. (No. 2).

TASMANIA

Office: 395 Collins St., Melbourne, Aus. Mine address: Mt. Balfour,

Russell Co., Tasmania. J. H. Opas, manager. Organized 1910, capitalization £151,000, increased Feb. 20, 1913, to £250,000, shares £10 par; issued £200,000.

Lands, 448 acres, including the Chesters Reward mine, long the main copper lode of the Mt. Balfour district, 50 miles from the port of Stanley. Country rock is laminated sandstone, in places interbedded with slate, and on the eastern side of the property is a belt of black slate, carrying some large quartz veins up to 70' in width, traceable several miles. Principal vein, carried for 5,000' on the company's lands, is developed by a 321' tunnel and 91' shaft, all in copper ore, with some drifting, and by shallow surface trenches showing 3 to 10' of ore carrying melaconite and chalcopryite, with gangue of graphitic slate and quartz, giving average assays of 2.4% copper, with small gold and silver values, and up to 12% copper from selected samples.

Company also has the right to build a railway from the mines to the port of Stanley, with full power to collect and retain tolls, build wharves and docks at Stanley and to control all shipping making use of these. The concession has a tenure of 50 years. Construction of the railway, which will have a length of about 50 miles, including 37 miles traversing rich agricultural lands, was begun early 1912. Property considered promising.

MOUNT BALFOUR PIONEERS, N. L.

TASMANIA

Office: 352 Collins St., Melbourne, Aus. Letter unclaimed at Mt. Balfour, Russell Co., Tasmania. Property, of little promise, was abandoned at shallow depth, on account of a heavy inflow of water. Idle several years and company dormant.

MOUNT BALFOUR PROSPECTING & MG. CO., N. L.

TASMANIA

Office: 352 Collins St., Melbourne, Aus. Mine office: Mount Balfour, Russell Co., Tasmania. Hal Sheppard, chairman. Mine has 2 tunnels, No. 1 showing a vein of bull quartz, carrying pyrite and specks of chalcopryite. No. 2 tunnel was said to show grains of native copper. Considerable surface work has also been done. Presumably idle.

MOUNT BOPPY BLOCK NO. 51, N. L.

NEW SOUTH WALES

Mine address: Mt. Boppy, Mouramba Co., N. S. W., Aus. Property held under option from the Mt. Boppy Copper Mining Co., N. L., is situated one-half mile south of that company's main shaft. Development is by a 200' shaft, showing a contact deposit between porphyry and micaceous sandstone, said to give average assays of 15% copper. Ores are mainly chalcocite and melaconite, high in iron content. Property considered promising.

MOUNT BOPPY COPPER MINING CO.

NEW SOUTH WALES

Office: Cobar, N. S. W., Aus. Mine office: Mount Boppy, Mouramba Co., N. S. W., Aus. J. P. Conley, chairman; G. Marshe, sec.; C. J. Elliott, gen. mgr. Organized Nov., 1906, under laws of New South Wales, capitalization £25,000, shares 12s. par; fully issued.

Owens the Burra Burra mine with 3 claims, 120 acres, held under a mineral lease; also a 4-acre mill site and 100,000 acres of timber land in the Geweroo district 4 miles from Canbelego and 6 miles south of Mt. Boppy, the nearest rail point. The Burra Burra, opened 1886, was worked spasmodically until taken over by the present company, Nov., 1906. The property shows 2 contact deposits between slate and porphyry, of about 6' average width, carrying malachite, chalcopryite, bornite, tetrahedrite and sphalerite, said to average 8% copper, 20 oz. silver and 2 dwts. gold per long ton. Development is by shafts of 200' and 300', and tunnels of 100' and 300'.

Equipment includes a 100-h. p. steam plant, with a 16-h. p. hoist, and there are 4 buildings, including a general office, assay office and mill, the latter of 50 long tons daily capacity, having 15 gravity stamps, 3 Alley tables,

1 Wilfley table, 1 Frue vanner and 3 slime tables. Mine was being worked by tributors, at last accounts.

MT. BROWNE COPPER & GOLD MG. CO. NEW SOUTH WALES

Office: Karangi, Fitzroy Co., N. S. W., Aus. P. Kritsch, manager. Organized 1908, under laws of New South Wales, capitalization £35,000, shares £1 par. Lands, in the vicinity of Goff's Harbor, are developed by a short tunnel and a shallow shaft, opening a 10' vein with a 2' paystreak, carrying copper carbonates and tetrahedrite, averaging about 12.5% copper. Equipment includes a 20-h. p. boiler, and a Blake pump. Is idle.

MOUNT BULGA COPPER CO. NEW SOUTH WALES

Address: N. Murray, Sydney, N. S. W. Mine and works office: Springfield, Bathurst Co., N. S. W., Aus. W. H. Trewenack, consulting engineer. Lands, 113 acres, at Mount Bulga, 9 miles east of Orange, well watered and with an ample timber supply available. The mine, discovered 1893, carries sulphide ore assaying up to 14.5% copper, found as impregnations in bands up to 25' in width, interbedded with slate. Development is by a 310' main shaft, having a hoist.

The old smelter, built 1902, was replaced 1910, by a new smelter having a 30-ton water-jacket blast furnace and blower. Several thousand tons of ore have been stoped from the 200' level, by the present and former owners. Temporarily idle, 4 months' suspension of the labor conditions being granted by the Mine Warden at Orange, to give time to raise fresh capital for development.

MOUNT CANNINDAH COPPER MINES, LTD. QUEENSLAND

Idle. Office: 280 Elizabeth St., Brisbane, Queensland, Aus. Mine address: Mount Cannindah, Bowen Co., Queensland, Aus. Hon. Robt. Philp, chairman; J. D. Campbell, Sir A. S. Cowley, Alex. Corrie and E. E. Tyler, directors; Thos. Welsby, sec., at last accounts. Organized 1906, under laws of Queensland, as a reconstruction of Mount Cannindah Copper Co., capitalization £30,000, increased later to £36,000, shares 2s. par; fully issued and fully paid.

Lands, 97 acres, carrying ore in brecciated dikes running through slates, in Gympie beds of upper Devonian age. The N.-S. Mount Cannindah dike has an extreme width of 110', with oxidized and sulphide ore carrying chalcocite and bornite, in a gangue of kaolinized slate, rich portions running 35 to 40% copper, but as a whole averaging about 2 to 3% copper. The main shaft is 190' deep.

The mill, with a rated capacity of 50 long tons daily, has a crusher, Krupp ball mill, Wilfley sand and slime tables, jigs and classifier, turning out concentrates of 20 to 35% copper tenor, with tailings assaying about 1% copper, held for leaching later.

The smelter, of about 25 tons daily capacity, has a 19x13' 6" reverberatory furnace, fired with ironbark wood. The McMurtry sintering pot process for desulphurizing concentrates before smelting was employed, with satisfactory results.

Company, apparently alive, but inactive. Property shut down since 1908.

MOUNT CARDWELL MINE. QUEENSLAND

At Nymbool, Cardwell Co., Queensland, Aus. See Mt. Molloy, Ltd.

MT. CARRINGTON COPPER MINES, N. L. NEW SOUTH WALES

Mine address: Drake, Clarence Co., N. S. W., Aus. Geo. Young, manager. Capitalization £10,000, shares 5s. par; issued 30,000 shares.

Lands, 65 acres, including the old Pioneer mine, 25 acres being held under lease, on the slopes of Mt. Carrington, 32 miles from Tenterfield and the railway.

Development is by a 1,200' tunnel, and several old shafts, deepest 180',

showing 4 veins, ranging from 1 to 5' in width, and variously carrying 10% and 3% copper, 2 oz. silver and \$3 gold per ton, up to 15% copper and \$5 combined gold and silver values.

Practically all ore above the 180' level in the Pioneer workings has been stoped out, and there are no definite ore reserves developed by the newer openings, excepting possibly 4,000 tons, which ore is estimated to carry an average of 6% copper.

MOUNT COFFIN COPPER MINE.

NORTHERN TERRITORY

Mine address: Leigh Creek, Northern Territory, Australia.

Property, 8 miles N. E. from Leigh creek, is developed by several shallow shafts and inclined tunnels, to a depth of about 80'. Country rock is a clay slate. Ores are mainly malachite and tetrahedrite, in veinlets and seams ranging from a few inches up to 3' in thickness. Idle since 1883, except for occasional work done by tributors.

MOUNT COSTIGAN & CORDILLERA CO.

NEW SOUTH WALES

Mine office: Mount Costigan, Georgiana Co., N. S. W., Aus. The mine, discovered 1880, was worked for silver-lead to depth of about 200', until 1889, when the mining and smelting plants were dismantled. It was reopened 1906, by present company, for copper ores below the water level. The mine has a vein of about 4' width, carrying mixed sulphides of copper, lead, zinc and iron, all argentiferous, similar to the silver ore in the lower levels of the Sunny Corner silver mine. Assays of ore have shown 12 to 20 oz. silver and 2 dwts. 4 grains gold per long ton. Company has apparently sold the mine to a new syndicate Sept., 1913, retaining an old shareholder as manager.

MOUNT CUTHBERT, N. L.

QUEENSLAND

Office: 39 Queen St., Melbourne, Aus. British office: Palmerston House, London, E. C., Eng. Mine office: Cloncurry, Queensland, Aus. P. Pigott, chairman; Hon. R. Philp, T. P. Power, F. E. Power, J. L. Wharton, J. Forsyth and E. L. Baillieu, directors; Edwin Habben, London sec.; R. W. Powell, mine mgr.; W. H. Corbould, cons. engr. Organized Feb. 21, 1907, under laws of Victoria, capitalization £240,000, shares £1 par, and re-organized Oct., 1909, under laws of Victoria, with same capitalization, shares £1 par; issued, 159,330 shares. Debentures, £140,000; issued £53,400, of which amount £30,000 was subscribed Sept., 1913, with privilege of conversion into stock until Dec. 27, 1914.

Lands, 33 leases, 449 acres, in the Mt. Cuthbert district, 80 miles from Cloncurry. Property shows several orebodies in a schistose formation, of which 7 under development show widths ranging from 2 to 8', traceable 700' and are reported to carry average values of about 8% copper and 50 cts. to \$2.50 gold per ton. Ores carry azurite, melaconite and cuprite, with some bornite in depth.

Principal development is on the Cuthbert and Kalkadoon leases, former opened by shafts of 401', 80', 80' and 30'. The Kalkadoon has a 170' shaft, now sinking, and another of 75', with a total of about 6,140' of workings. Ore reserves in the Cuthbert mine are estimated at 220,000 tons of about 7% copper tenor. The Warwick Castle lease has shafts of 106', 76' and 35', and the Surprise lease has shafts of 100' and 80'. The Mighty Atom and Little Wonder leases are slightly prospected, the B shaft of the former being 62' deep with 3' of 20% ore and the C. shaft 90' deep showing 3' of 25% ore. A new shaft is to be sunk 200' at once.

Equipment includes a 230-h. p. steam plant, with 5 hoists and a 6-drill air compressor. There are also 14 buildings including a sawmill, smithy and 4 stores.

A smelting plant is under consideration and rail connections with the Cloncurry railway is in good prospect.

MOUNT DIAMOND MINE.**NORTHERN TERRITORY**

Mine office: Wandie, Northern Territory, Australia. Property, 240 acres, leasehold, 5 miles N. E. of Wandie, formerly held by the Mount Diamond Corporation, Ltd., having a vein of about 40" average width, said to be traceable 900'. Mine is opened to a depth of 200', and for a length of about 450', the 200' level south drift showing a 3' vein of ore carrying chalcopryite associated with pyrite, in quartz gangue, estimated to average about 8% copper.

MOUNT ELLIOTT, LTD.**QUEENSLAND**

Office: Palmerston House, London, E. C. Eng. Australian office: 39 Queen St., Melbourne, Aus. Mine office: Mt. Elliott, Cloncurry, Beaconsfield Co., Queensland, Aus. Wm. Clark, chairman; P. I. Becker, R. H. Henning and W. D. Reid, directors; Hon. W. L. Baillieu, chairman; G. W. W. Mackinnon and W. S. Robinson, directors Australian board; F. G. Hughes, sec.; Edwin Habben, London, sec.; W. H. Corbould, gen. mgr.; H. P. Richards, mine supt.; E. A. Weinberg, cons. engr.

Organized 1906, under laws of Victoria, and reorganized June 14, 1907, under laws of Great Britain, capitalization £750,000, shares £5 par; issued, £737,590, fully paid. First dividend, 10s., was paid April, 1911, and total dividends to March 1, 1913, were 52s. 6d. per share.

Lands, 803 acres, in several groups, from 58 to 72 miles south of Cloncurry, including the Mt. Elliott mine of 300 acres, the Selwyn of 90 acres, the Trafalgar of 93 acres, the Kings Cross of 10 acres, the King Solomon of 160 acres, the Consols of 40 acres and the Floradora, Albion and Revenue mines aggregating 110 acres; also working options and leases in the neighborhood of the Trafalgar mine, options on the Castle Mountain mine, the Danube mine and on various parcels of land 38 miles west of Cloncurry.

The Mt. Elliott property shows a big outcrop of good ore in an area of upturned pre-Devonian slates and schists, ore occurring in lenticular masses, the main lens being of 50 to 60' width, and about 220' in length, with good ore proven by the diamond drill to a vertical depth of 600'. The upper workings show cuprite and considerable chrysocolla associated with limonite and siderite, succeeded by chalcocite and chalcopryite associated with small quantities of pyrrhotite. Ore reserves were estimated by the management, June, 1912, at 85,000 long tons, averaging 10% copper and 350,000 tons averaging about 3% copper.

The mine is developed by a 125' vertical shaft and a 520' incline shaft, in addition to which there are some opencast workings. The first level is at 125', and second at 185', with levels at 100' intervals thereafter, the 385' level being reported to show 3 parallel lenses of sulphide ore, narrow, but of good average grade. The mine made 2,460' of new openings, 1912, and ended 1913, with about 2 miles of workings.

In 1913, company was actively developing its outlying properties. The 148' and 140' Trafalgar shafts show ore on the newly opened 110' level. The 113' Kings Cross shaft shows 6' of silicious ore with 13% copper. The King Solomon has ore in limestone opened by 2 shafts and the Revenue mine has been equipped with steam hoist, unwatered and developed.

Property is reached by a 72-mile railway line from Cloncurry.

Equipment includes a 150-h. p. steam plant at the mine, with 25 and 50-h. p. hoists, good for 300' and 600' respectively, and two 10-drill Ingersoll air compressors. There are about 20 mine buildings, including a 25x30' machine shop, 25x30' smithy and a sawmill.

Smelting was suspended March 19, 1913, owing to labor troubles, and resumed in August, treating 3,596 tons in 25 days and producing 857,024 lbs. fine copper, 649 oz. gold and 1,006 oz. silver.

The smelter, which is one of the most complete in Queensland, has steel-frame buildings, with a water-jacket blast furnace of about 200 tons daily capacity, blown in Sept. 29, 1910, and operated electrically throughout. There are 3 converter stands with 60x96" shells of Leghorn type.

Production for fiscal year ended June 30, 1912, was 39,933 tons of ore, yielding 5,243 tons copper, 9,419 oz. gold and 7,320 oz. silver. Property considered promising and management good.

MOUNT FEDERAL MINE.

QUEENSLAND

Address: Cloncurry, Queensland, Aus. Wm. Orr, owner; A. M. Hogarth, supt. Property, 22 miles west of Cloncurry, is developed by 4 shafts, deepest 150', showing replacement deposits. Ore is mainly bornite of about 50% copper tenor. A traction engine, hauling 20-ton loads transports ore to the smelters.

MOUNT FLORA COPPER CO.

QUEENSLAND

Idle. Mine office: Mackay, Carlisle Co., Queensland, Aus. Lands include three 100-acre tracts known as the Mount Flora, Wallaroo and Eastern Selections mines, also the Fairview mine. The Wallaroo has several copper veins, including 1 of 18' reported average width, carrying to shallow depth melaconite, azurite, malachite and occasional native copper, succeeded by chalcopryrite. The Wallaroo has a 140' shaft and has shipped ore ranging 15.5 to 43.5% in copper tenor. The Fairview mine has a 265' tunnel showing a vein of 80' estimated average width, carrying a hanging-wall paystreak of good ore.

MOUNT GLANCE MINE.

QUEENSLAND

Address: Mt. Elliott, Cloncurry, Queensland, Aus. Messrs. Stuart and Wastyn, owners. Mine, 14 miles south of Mt. Elliott, is opened by 2 shafts of 50' and 35', showing occasional pockets of ore.

MT. GODKIN CONS. COPPER MINES, N. L.

QUEENSLAND

Property sold to Era Mining Properties Development Syndicate, Ltd.

MOUNT GORDON COPPER CO.

QUEENSLAND

Office: Cloncurry, Queensland, Aus. Capitalization £1,600, shares £1 par. Property consists of sundry mineral leases in the Cloncurry district. No trace of operations securable.

MT. GUNSON PROPRIETARY MG. CO., N. L. SOUTH AUSTRALIA

Office: Grenfell St., Adelaide, South Australia. Mine office: Pernatty Lagoon, South Australia. Works office: Port Augusta, South Australia. Lands, 460 acres, 1 mile west of Pernatty lagoon, 5 miles S. E. of Mount Gunson and about 90 miles N. W. of Port Augusta. The mine, discovered 1875, and worked in an exceedingly small way before the present ownership, has 2 practically parallel veins, with N.-E. strike, of 6 to 14' estimated average width, having 6" to 3' paystreaks carrying malachite, azurite and tetrahedrite, giving average assays of about 26% copper, with intermediate bands of low-grade ore. The old mine shows carbonate impregnations, apparently occurring as infiltrations, in practically horizontal veins in quartzose sandstone, and in jointing planes and cracks that carry copper carbonates and chalcocite as crusts and films. Considerable trenching and test-pitting has been done, over an area one-half mile wide by 1½ miles long.

The smelter, built 1905, with 1 reverberatory furnace, is 90 miles from the mine. The ore is highly silicious, and the iron ore used for fluxing also being silicious, caused much trouble in smelting. A new plant, for experimental purposes, was in the course of erection, 1912.

MOUNT HECTOR COPPER MINES, LTD.

QUEENSLAND

Idle. Office: Brisbane, Queensland, Aus. Mine office: Glassford Creek, Bowen Co., Queensland, Aus. Thos. Gibb, managing director; Thos.

Welsby, sec. Company was organized with capitalization £25,000, shares £1 par, and reorganized 1907, with capitalization £25,000, shares 5s par.

Lands formerly were 346 acres, including the Monument, Furnace and Welch leases, 7 miles north of Glassford creek and 29 miles from a railway, in the Monal goldfield, but all leases excepting the Welch, upon which the smelter stands, have been abandoned. Lands show rocks of Devonian age, carrying auriferous and slightly argentiferous copper ores, with fluxing material on the property.

The smelter, connected with the mine by a ground tram, has a crusher and one 20-ton reverberatory furnace, making matte of about 55% copper tenor, but the reverberatory was dismantled and a 50-ton water-jacket blast furnace blown in, August, 1908.

MOUNT HOPE COPPER MINES CO.

QUEENSLAND

Mine office: Cloncurry, Beaconsfield Co., Queensland, Aus. Organized 1906, under laws of Queensland, capitalization £30,000. Lands, leasehold, include the Mount Hope, Mount Hope North, Regina and Aurum mine. Idle since 1908, except for prospect work, which has proven disappointing.

MOUNT HOPE MINES, N. L.

NEW SOUTH WALES

Office: 114 Pitt St., Sydney, N. S. W., Aus. Mine office: Mount Hope, Blaxland Co., N. S. W., Aus. H. Ernest A. Miller, agt.; J. M. Rees, legal mgr. Organized 1908, as a reconstruction of Mount Hope Copper Proprietary, which was a reconstruction of Mount Hope Copper Mining Co., N. L., which also was a reorganization of a preceding Mount Hope.

Lands, about 600 acres, freehold, well watered, about 90 miles south of Cobar and 80 miles west of Condobolin, the nearest rail point.

The mine, discovered 1878, opened 1880, has had a somewhat checkered career, having been closed and reopened fully a half-dozen times. The property is reported by the management to have produced upwards of £600,000 worth of copper, to the end of 1901.

The property shows altered sandstone, carrying 3 parallel veins of close-grained ferruginous slates, seamed with quartz veinlets carrying ore. The oxidized zone, extending to a depth of about 160', carries mainly earthy malachite and azurite, with occasional cuprite, succeeded by sulphides, with clean sulphide ore of 4.5% to 7% copper tenor below a depth of 370'. The ore shades into the walls, which are impregnated for some distance, the main orebody having an extreme width of 80' and resembling the Great Cobar mine in several respects. Former workings were mainly in the oxidized zone, but the last mining was done at depth, in sulphides. The mine has a 320' main shaft, showing, on the bottom level, a 30' vein, and has some stopes of 30 to 50' width, ore shoots being up to 200' and 300' in length.

Equipment includes a fair machinery plant at the mine. The mill has Hancock jigs, making concentrates of 15 to 25% copper tenor.

The smelter has 5 small reverberatory furnaces. Iron ore for fluxing is secured from a quarry 12 miles from the mine. Idle since 1908.

MOUNT JASPER COPPER MINES, N. L.

TASMANIA

Idle. Office: 325 Collins St., Melbourne, Aus. Mine office: Heazlewood, Russell Co., Tasmania. J. H. Opas, legal manager. Capitalization £12,000, shares £5 par; issued, £10,500.

Lands, in 2 groups, including the Mt. Stewart mine, are on the Whyte river, in a very rugged, but well-timbered section. Country rock is serpentine and ores carry chalcopyrite and pyrites in the Mt. Jasper mine and silver-lead ores in the Mt. Stewart. The Mt. Jasper has 2 tunnels and a shallow shaft, and the Mt. Stewart has shafts of 200' and 45' and a 114' tunnel.

MOUNT LYELL BLOCKS COPPER MINES, N. L.

TASMANIA

Secretary's address: T. Rollason, Queen St., Melbourne, Aus. English

office: Palmerston House, London, E. C., Eng. Mine office: Linda Valley, Montagu Co., Tasmania. Colin Templeton, Alfred Tolhurst, Thos. Harvey and Alex. Campbell, directors; Edwin Habben, London sec.; Robert Ferguson, gen. mgr. Organized June 20, 1910, as a reconstruction of Mount Lyell Blocks Mining Co., N. L., which in turn was a reconstruction of Mount Lyell Blocks Copper Corporation, Ltd. Capitalization £300,000, shares £1 par; fully issued, 18s. 6d. paid in.

Lands, 317 acres, including 17 acres held under mineral lease, 60 acres timber lands, 150 acres miscellaneous lands and a mill site, and in addition the company has the right to mine on adjoining lands of the Mount Lyell Consols, for 7 years, on a royalty of 40% of net profits.

The property has 2 low-grade orebodies, consisting of native copper, in minute particles, disseminated quite evenly, through argillaceous schists, locally termed clays, as the schists are very soft and weather readily. These orebodies are estimated to carry about 1½% copper. The property also shows sulphide ores giving assays upto 6% copper in a 30' bed of conglomerate. No work has been done on these beds for some years.

Development is by the 1,200' Main shaft, 240' Balance shaft, the 680' Office tunnel and the 2,255' Consols tunnel, latter connecting with the Main shaft on the 450' level. Ore reserves, Dec., 1910, estimated at 60,000 tons. The ground is very soft and is exceedingly treacherous, requiring heavy timbering.

Equipment includes steam power and an air compressor. There is a small sawmill, with a framing mill for mine timbers. Fuel is wood, costing 10s. per cord. Nearest railway is the Mount Lyell & North Mount Lyell line, 5 miles distant.

A 350-ton steel frame concentrator has 10 gravity stamps, 20 Wilfley and Phoenix-Weir tables, canvas tables and 12 Frue vanners. The mill gave very unsatisfactory results at first, but, after minor changes did fair work, the ore being concentrated easily, but yielding small returns because lean.

The mine formerly employed about 250 men, but has secured no production since 1907. Was developing, with a small force, Sept., 1913.

MOUNT LYELL COMSTOCK COPPER CO. LTD. TASMANIA

In liquidation. C. A. Sack, liquidator. Property sold 1912, to Mount Lyell Mining & Railway Co., (which see). Fully described Vol. X.

MOUNT LYELL CONSOLS WALLAROO

COPPER MINES, N. L.

SOUTH AUSTRALIA

Secretary's address: T. Rollason, 31 Queen St., Melbourne, Aus.; London secretary, E. Habben, Palmerston House, E. C. Mine office: Kadina, Daly county, So. Australia. J. A. Wauchope, gen. mgr.; T. C. Dunster, chairman; S. Cherry, W. P. Jarvie, E. J. Hartley and C. B. Holland, directors.

Organized Nov. 20, 1911, as a reconstruction of Mount Lyell Consols Copper Mines, N. L., capitalization £250,000, shares 10s. par; issued, 350,000 shares.

Lands, 150 acres, leasehold, including the Wallaroo Central mine, 70 acres, adjacent to the Wallaroo mine. The Mount Lyell Consols mine, in Tasmania has been abandoned and the machinery plant formerly in service there has been disposed of.

The Wallaroo Central property shows schists and slates carrying numerous parallel veins including the famous Wallaroo Blue lode. Development is by a 260' shaft, showing 2 lodes of 18' and 7' average width, carrying ore with about 6% copper and \$8 gold per ton.

Equipment includes a 250-h. p. steam plant with hoist, air compressor, and there are necessary mine buildings.

Property considered promising, but company is without sufficient working capital and another reconstruction is probable.

MOUNT LYELL MINING & RAILWAY CO., LTD.

TASMANIA

Office: 39 Queen St., Melbourne, Aus. British office: Palmerston House, Old Broad St., London, E. C., Eng. Operating and works office: Queenstown, Tasmania. Mine office: Gormanston, Tasmania. Wm. Jamieson, chairman; Bowes Kelly, Lindsay Tulloch, Colin Templeton and Hon. Geo. Swinburne, M. L. A., directors; London directors, A. Williamson, chairman; Sir John A. Cockburn, K. C. M. G., John Ball and W. Douglas Reid; D. G. Lumsden, sec.; W. G. Moss, asst. sec.; Edwin Habben, London sec.; Robt. C. Sticht, gen. mgr.; Basil Sawyer, local supt; B. Stafford Bird, Tasmanian agt.; Robt. P. Roberts, chief metallurgist; R. M. Murray, mine supt.; E. Carus Driffeld, railway supt.; G. F. Jakins, asst. engr.; G. W. Wright, mech. engr.; Thos. W. Haynes, business mgr. of chemical works.

Organized Aug. 11, 1903, under laws of Victoria, as a merger of a former company of the same name, with the North Mount Lyell Copper Co., Ltd., capitalization £1,300,000, shares £1 par; issued, £1,300,000. Debentures of the former North Mount Lyell, £140,000, at 5%, were retired 1908, leaving the company without bonded debt. Profit for fiscal year ending Sept. 30, 1910, was £205,000. Balance of liquid assets was £455,500 March 31, 1908, and £405,420 Sept. 30, 1910. Dividends have been as follows: £150,000 in 1904, £195,000 in 1905, £345,000 in 1906; £330,000 in 1907, £210,000 in 1908, £210,000 in 1909, £180,000 in 1910, £75,000 in 1911 and the same amount in 1912. The present company paid dividends, to end of 1912, aggregating £1,770,000, and former company paid dividends of £996,574, giving total dividends, to end of 1912, of £2,766,574. Half-yearly meeting, May; annual meeting, November.

The operations of the company are very extensive, including the mining and smelting of copper ore in Tasmania, the mining of pyrite in Tasmania, with the manufacture of acid and superphosphates in the states of Victoria, South Australia and Western Australia, and the manufacture of coke in New South Wales, the activities of the company thus embracing every state but Queensland in the Australian commonwealth. The methods employed in the various works of the company are of a notably high technical order.

Lands are 2,124 acres, inclusive of 5 consolidated leases, for 21 and 30-year periods, and 565 acres of mill and smelter sites, in the Mt. Lyell district, with mineral lands in other parts of Tasmania where prospecting and mining work is in progress. The Chester mine, in the North Pieman district of Russell county, north of the Pieman river, produces about 1,000 tons of iron pyrites monthly for the various acid works of the company.

The principal mining operations are in the Mt. Lyell district, on the western coast of Tasmania, at a distance of about 14 miles in an air line from the port of Strahan, on Macquarie harbor. The Mt. Lyell pyritic orebody was discovered 1883, and the gossan outcrop, known as the "Iron Blow," was worked for gold in a small way for a short time. Although the pyritic orebody outcropped, its value for copper was not recognized for some years. Actual copper mining was begun 1882, by the predecessor of the present company, and since 1895, the present management with practically the same personnel has been in charge. Other mines opened in the same district did not secure practical results, although the existence and value of the North Mount Lyell mine were recognized in 1897, when development was begun, and continued until the property was merged in the present company, 1903. Owing to the silicious nature of the North Lyell ore, neither concentration nor smelting were successful, and the undertaking was a failure financially after the expenditure of about £800,000. The amalgamation of the 2 mines,

effected 1903, gave a single magnificent property, the pyritic ore of the Mount Lyell and the silicious ore of the North Mount Lyell being natural smelting complements. The Mt. Lyell mine proper is the lowest grade copper mine in the world now worked successfully, and that it is successful is due to the desirability of its ore for fluxing the richer ore of the North Lyell, and the great technical skill with which the property has been developed and is operated, reinforced by the financial courage and sanity of the general management.

Country rocks of the Mt. Lyell mine are hydro-mica schist, conglomerate, quartzite and sandstone, with mineralization occurring along a schist conglomerate contact that is a crush zone formed by an overthrust fault. The orebody is a huge lenticular mass, measuring 270' wide by 660' long, on the 4th level, with an ascertained depth of 685'. This lens originally contained 6,500,000 long tons of ore, about two-thirds of which has been extracted. The ore from the upper workings carried up to 4% copper, 4 oz. silver and 0.16 oz. gold per long ton, but average ore at present carries only 0.53% copper, 2 oz. silver and 0.03 oz. gold per ton. The ore is a very clean slightly cuperiferous pyrite, carrying only about 3.75% silica, 2.6% alumina and 1.8% barium sulphate, with a little zinc and a trace of lead.

The copper occurs as chalcopyrite and tetrahedrite, disseminated through the pyrite. One end of the orebody carried an enrichment, persisting from surface to the bottom of the lens, consisting of a mixture of chalcopyrite and bornite, with a little chalcocite, and in 1894 this part of the mine yielded 850 tons of this ore, enriched by stromeyerite up to a tenor of 21% copper, 1,010 oz. silver and 0.1 oz. gold per long ton, this bonanza deposit netting the old company £105,000 in London, which sum, together with the report on the property from Dr. Edw. Dyer Peters, afforded the necessary stimulus to finance the original company.

The Mt. Lyell mine, lying on a hillside, has been developed, since 1892, by a system of tunnels, crosscuts and contour drifts encircling the orebody, in 8 levels, but the 5 upper levels have been obliterated by a monstrous quarry, from which the ore is extracted in a series of benches with simultaneous removal of overlying or underlying country rock. The ultimate bottom of the quarry is No. 5 level, at depth of 450' from surface; below this level only underground extraction is feasible. A vertical blind shaft connects the 5th level with the 3 levels below, and all are accessible from surface by an incline hoisting shaft, which also serves the quarry. Underground developments, beneath the pit, were begun actively early 1909, giving a productive capacity of 800 to 1,000 long tons of ore daily, from opencast and underground workings combined. In the underground workings ore is stoped in large sections and depleted stopes filled with waste rock from the capping previously removed. The pit has a traveling crane and is electric lighted. The removal of the schist and conglomerate overburden is nearing completion and the finished work will give about 2,000,000 cu. yds. of capping removed, to render available 1,070,000 cu. yds. of ore. A little cement copper is secured from the mine water. It was estimated, Sept. 30, 1912, that the Mt. Lyell proper had ore reserves of 327,209 long tons available for opencast extraction, and 2,033,973 tons available for underground mining, this ore having an estimated average assay of 0.532% copper, 1.96 oz. silver and 0.027 oz. gold per ton. For the half year ending Sept. 30, 1912, the Mt. Lyell mine shipped 96,936 long tons of ore, averaging 0.51% copper, 1.86 oz. silver and 0.040 oz. gold per ton. The mine output is about 700 tons of pyrite ore daily, mostly from the 3 underground levels, the 3 lower benches of the opencut supplying a minor amount.

The South Mt. Lyell orebody is a lens of the same character as the big

orebody of the Mt. Lyell, though much smaller, and not outcropping at surface, being opened from the Mt. Lyell mine and practically a part of that mine. Development 1913 was mainly on the 800' level, the bottom level of the Mt. Lyell mine. South Lyell is about ready for regular production.

The incline shaft at the Mt. Lyell, which raises all ore from the mine, has a 200-h. p. electric hoist, taking current from the reduction works power plant by a 1½-mile special line. Hoisting is in self-dumping skips. At this mine there are 2 Australian-built Corliss cross-compound air compressors, with capacity to reduce 3,100 cu. ft. of free air per minute to 90 lbs. pressure per square inch, and the air supply is diverted, when required, to the North Mt. Lyell mine by means of a 6,000' pipeline.

The North Mt. Lyell mine carries ore as disseminations in highly quartzose schist, in the vicinity of a conglomerate contact, the schistose ore shoots occurring as pipes, or columns, of irregular cross-section, in the recesses of the highly contorted contact surface of the conglomerate. Copper values are mainly in bornite, but there are limited quantities of chalcopyrite and chalcocite, associated with small amounts of pyrite, and there are no deleterious elements. The North Lyell ore averages, as broken, about 6% copper and 1.8 oz. silver per long ton, with a trace of gold, the gangue averaging about 66% silica, 7% iron and 7.5 to 11% alumina. The North Mt. Lyell has a number of closely associated but distinct orebodies, the 2 largest being the Main and New Development orebodies. The Main orebody outcropped at surface, and has a vertical dip with depth proven to 1,000'. The New Development orebody connects with the Main orebody on the 400' level, descending at a very sharp pitch, and carries disseminated bornite of good average grade on the 1,100' level, which is the deepest working of the mine. The character of the ore remains unchanged down to the lowest level opened, except that perhaps chalcocite is increasing with depth.

Development consists of tunnels of 850' and 1,080', and 2 shafts, the Main of 1,180', and the Auxiliary of 800', latter a blind shaft from the 300' level. The lower levels are opened at 150' intervals. Stoping is in progress on all levels from the 400 to 1,100', inclusive, and is heaviest on the 850' level, where the New Development and various subsidiary orebodies show a striking enlargement in area. Filling for depleted stopes is brought from surface by means of 2 main mullock passes, and run to place through branch passes. For 6 months ending Sept. 30, 1912, the North Lyell produced 58,768 tons of ore, with average assay of 5.45% copper, 1.14 oz. silver and 0.0028 oz. gold per ton, and at this date reserves were estimated at 1,083,752 long tons of an average assay value of 6% copper, 1.33 oz. silver and 0.005 oz. gold. The North Lyell has developed wonderfully well and it is evident that the property has excellent prospects of further considerable orebodies, while the ore is persistent to the greatest depth yet reached and high in copper tenor and, although too silicious for straight smelting, blends with the pyritic ore of the Mt. Lyell in an ideal smelter charge. The daily output of the mine averages 400 tons.

The North Lyell working shaft has a 206-h. p. electric hoist, good for 1,500' depth, and the plant includes a 20-drill air compressor, driven by a 350-h. p. motor. The mine water, which is very acid, is forked by 3-throw electric pumps.

The Lyell Tharsis mine, formerly considered worked out, was acquired by the company some years ago and is worked for ore of the same mineralogical character as that of the North Lyell, though very much lower in grade.

The South Tharsis and Royal Tharsis mines are idle. The South Tharsis mine was worked opencast for a time, and the Royal Tharsis has been

developed for underground working by an incline shaft. These properties carry chalcopyrite and pyrite, disseminated sparingly in schist, and the ore, of very low average grade, though not amenable to ordinary wet concentration, will be mined at some future time for flotation concentration.

An important new mining property purchased by the company in 1912, is that formerly belonging to the Mt. Lyell Comstock Mining Co., Ltd. Total area of leases 339 acres. The southernmost sections are contiguous to the North Mt. Lyell leases and contain the northern extensions of the orebodies in the latter, which give them a special value to the company. The deposit worked by the former owners is, however, remote from this locality, being 6 miles, by steam tram, from the reduction works. The mine has been recently reopened by the company and is worked on a steadily increasing scale. The deposit here occurs on the same line of contact of schist and conglomerate as the other properties in the district and the character of the ore is similar to that of the North Mt. Lyell mine, though more basic, while the ore in the southernmost sections is, of course, identical with that of the North Mt. Lyell orebodies themselves.

Near the reduction plant there are extensive silica and limestone quarries, for flux.

The company owns and operates sawmills, at various points, for furnishing mine timber and lumber for general building purposes.

A $1\frac{1}{2}$ -mile aerial tram transports 1,500 tons daily from the Mt. Lyell mine to the smelter. There also is a 4,500' incline surface tram, operating cars in counterbalance, connecting with a three-fourths mile steam railway. The output of the North Mt. Lyell goes by a 1-mile steam tram to the incline tram. Mine timber is hauled from the valley on the mine side by a $1\frac{1}{4}$ -mile aerial tram, gaining an elevation of 1,000'.

The company owns 2 railway lines; a 22-mile line connects the reduction works at Queenstown with the seaport of Strahan, giving rail connections with all parts of the state. This line traverses an exceedingly rough country, $4\frac{1}{2}$ miles having gradients of 1 in 20, and 1 in 16, requiring 4 special Abt-type locomotives, using a center-rack rail, in addition to 3 Baldwin adhesive engines. Equipment includes 135 cars, and the line does a general business, in addition to handling all the company's traffic. The second line connects Gormanston with Kelly Basin, near the head of Macquarie harbor, 25 miles from Strahan. It was built by the North Mount Lyell Co., but since the amalgamation of the 2 companies in 1903 has been operated on a limited scale. The company's private narrow-gauge line has about 7 miles of track, connecting the mines and works.

The 250-ton North Lyell smelter, 11 miles from the mine, has long been dismantled.

The reduction works are at Queenstown, on the Queen river, $1\frac{1}{2}$ to $2\frac{1}{2}$ miles from the mines. No. 1 smelter has been dismantled for some years. No. 2 smelter has six 54x210" blast furnaces, with cast-iron water jackets of solid construction, suitable for pyritic smelting. The capacity is in excess of present requirements, being about 2,000 tons daily. The furnaces have special mechanical feeders and as the smelting column has been lengthened to 18' from tuyeres to edge of downcast, hydraulic lifts also are employed. The 9 No. 8 and 3 No. 7 Connorsville blowers formerly employed were replaced by two 1,025-h. p. Parsons turbo-blowers, of 36,000 cu. ft. capacity each, and one 460-h. p. Parsons turbo-blower, of 18,000 cu. ft. capacity, all driven by steam turbines, giving a 64-oz. blast pressure.

The first successful pyritic smelting ever accomplished was done in this plant, in 1896, under the direction of Mr. Sticht, and the method has been greatly improved since then. Formerly 2 fusions were required, the first

giving a 15% matte, with a concentration of 6 into 1, slags averaging 0.3% copper, the first-fusion matte afterwards being brought up to 40 to 50% copper, without previous calcining. This practice was improved 1903, only a single fusion being required. The pyritic ore from the Mount Lyell, and the silicious ore from the North Mount Lyell, form an ideal smelting charge which has to be supplemented only by a small amount of limestone for fluxing. The charge, averaging 2:25% copper, is brought to a matte of 40 to 50% copper. Slags average about 0.33% copper, 32 to 38% silica, 42 to 52% iron protoxide and about 4% calcium oxide.

The percentage of coke was formerly as low as 1% but is now 3 to 5% in consequence of a reduction of the iron sulphide contents of the ore and an increase of the zinc and lead.

The furnaces have a stationary rectangular forehearth, supplemented by smaller rectangular forehearths, from which the slag flows into a stream of water for granulation. Granulated slag is distributed over the slag dump by three 90-h. p. centrifugal pumps. Matte tapped from the main forehearth is allowed to cool, before conversion, the conversion of matte direct from the blast furnaces being subject to local difficulties that have not yet been overcome.

The 75-ton converter plant has 2 remelting furnaces, with 6 stands, and 14 shells of the Stahlmann type, each 60x96". Converter blast is furnished by two 16x24x309" Riedler steam-driven compound condensing air compressors, each compressing 3,000 cu. ft. of free air per minute. The final product is blister copper averaging 98.83% copper, about 80 oz. silver and 1.5 oz. gold per long ton, the silver contents having declined about 20% and the gold contents about 40% in recent years. For many years, until the end of 1910, the blister copper was sent to Baltimore, for electrolytic refining, but now goes to the Port Kembla works, in New South Wales.

The smelter power plant includes 16 Babcock & Willcox and 3 Stirling water-tube boilers, supplemented by superheaters, surface condensers with air pumps, 2 Green and 1 Lowcock fuel economizer, with induced draught fans, and all subsidiary paraphernalia. The steaming capacity is 110,000 lbs. per hour. There are three 600-h. p. Parsons-Brown-Boveri turbo-generators, and a complete outfit for the distribution of electric current to numerous points, and for many uses, including the power required about the smelter, hoisting and pumping at the mines and electric lighting. A hydro-electric installation at Lake Margaret is now in process of erection and will abolish the use of wood and coal as fuel.

There is a large modern machine shop at the smelter, well supplied with motor-driven machine tools, and a well fitted foundry, having both iron and brass cupolas. There also is a steel foundry, a boiler shop, tinshop, carpenter shop, a brick and pipe plant and minor shops, as the mines and smelters occupy an isolated position, necessitating shops equipped to do heavy emergency work of a constructive nature, as well as repairs.

The water supply for the mines is derived from Mount Owen, a 300,000-gal. reservoir giving high pressure. The water supply of the reduction works, brought by gravity direct to the plant, has been supplemented by the construction of 2 storage reservoirs, with a joint capacity of 80,000,000 gals.

The company maintains coke works at Port Kembla, N. S. W., Aus. This plant, doing a general custom business, in addition to meeting the company's requirements, formerly had 62 ovens, recently rebuilt on more modern lines with 36 funnel-shaped ovens, and has all the accessories of a modern plant, including a combined coal-compressing and coke-pushing machine with a coal washery for cleansing the coal from the Mount Kembla coal mines, before grinding.

In 1905 the company engaged in a somewhat tentative way in the manufacture of acid and superphosphate, building a plant at Yarraville, a suburb of Melbourne, Victoria. This plant, built along American lines, proved very successful and led to the erection of similar acid and fertilizer works at North Birkenhead, near Port Adelaide, South Australia, 1908, and a third similar plant was completed 1910, at Rocky Bay, near Fremantle, Western Australia. The North Fremantle plant is notably well designed and complete, costing about £90,000. The chemical plants have Herreshoff calciners and use the ordinary chamber process for making sulphuric acid. The Yarraville plant has been reconstructed according to the most modern ideas for labor saving, and perfect product, and the other plants are being altered accordingly. Crude phosphate rock is secured from Ocean and Christmas islands. The products of these plants include a variety of superphosphates and commercial fertilizers, demand for which is increasing very rapidly in Australia. The raw material for acid is furnished by the Chester mine, and originally Mount Lyell cupriferous pyrite was used also, for this purpose. At the North Fremantle works, Spanish pyrites are used for the present, though it is hoped that a local supply can be secured later, the high freight rates on Tasmanian pyrite precluding its use for the present. Unfortunately, it is commercially impracticable to utilize the sulphurous acid fumes from the Mount Lyell smelter, because of the very high freight rates encountered, either in carrying the acid away from Mount Lyell, or bringing in the crude phosphate rock.

The company employs about 1,900 men in Tasmania, in addition to considerable forces at the 3 fertilizer plants. About 850 men are employed at the mines, 150 on the railways, and 900 at the reduction works.

Although the average of all ores smelted is only about 2.25% copper, and the pyritic ore now mined from the Mount Lyell mine proper barely exceeds a copper content of one-half of 1%, the cost-sheet makes an excellent showing. Mount Lyell pyritic ore, won opencast, cost about 3s. 6d. per long ton, inclusive of the charge of 2s. for removal of overburden, and cost of ore extracted from underground workings does not exceed 6s. per long ton. Ore mined from the North Mount Lyell costs about 10s. per long ton and constitutes about one-third of the total ore tonnage.

The average cost of mining, smelting and converting, from 1896 to 1903, was \$5.48 per ton, and by this company for 6 years ending 1909, the total mining and smelting cost per ton was \$3.56, a figure that reflects great credit upon an efficient manager and staff. For the fiscal year ending Sept. 30, 1912, costs were \$4.85 per long ton, the increase being due chiefly to the increased cost of production of Mt. Lyell ore, due to the increasing proportion of ore won underground.

Since the organization of the present company 1903, production has been remarkably uniform, the average of ore smelted varying but little from 408,000 long tons yearly, while the production of blister copper has been fairly constant at an average figure of 8,550 long tons. Including the production of the old company, from 1896 to Aug. 11, 1903, the total production by the company, to Sept. 30, 1912, was 5,280,186 long tons of ore, yielding 120,852 long tons fine copper, 10,112,472 oz. silver and 310,292 oz. gold. Of the tonnage smelted, 3,891,683 long tons were supplied by the Mount Lyell mine, 1,075,566 tons by the North Mount Lyell mine, 167,097 tons were purchased ores, and 145,278 tons consisted of metalliferous fluxes. Recent production has been as follows: 20,180,578 lbs. fine copper, 703,945 oz. silver and 23,087 oz. gold in 1906; 17,664,466 lbs. copper, 700,087 oz. silver and 19,449 oz. gold in 1907; 19,357,229 lbs. copper, 681,262 oz. silver and 19,532 oz. gold in 1908; 19,746,719 lbs. copper, 728,707 oz. silver and 13,345 oz. gold in 1909;

18,237,268 lbs copper, 664,575 oz. silver and 13,299 oz. gold in 1910; 17,606,400 lbs. copper, 544,557 oz. silver and 10,375 oz. gold in 1911; 10,317,440 lbs. copper, 315,739 oz. silver and 6,174 oz. gold in 1912.

Output of 1911 was affected by the first serious strike which the company has suffered, hanging up work for the last quarter of that year. In 1912, the output was further diminished by the shortage of labor due to this strike and still more to a disastrous fire which occurred in the North Mt. Lyell mine in October and shut down that property until early in 1913.

The output for 12 weeks, June to Sept., 3, 1913, was 68,270 tons, yielding 2,589,440 lbs. fine copper, 68,270 oz. silver and 2,064 oz. gold.

The Mount Lyell enterprise has had to contend with a series of grave financial, mining and metallurgical problems, all of which have been solved with great skill and signal success. A serious handicap is the heavy rainfall, averaging 110" yearly, hampering a mine worked opencast. Furthermore, two-thirds of the ore averages even lower in copper contents than the leanest of the successful native copper mines of the Lake Superior district, which, for 2 generations, have been treating the lowest grade copper ore in the world, until this unenviable, but highly creditable distinction, passed to the Mount Lyell. The change of policy, inaugurated 1905, by which the company has increased the scope of its operations, through the extensive manufacture of sulphuric acid and commercial fertilizers, is in line with the thoroughly sound British policy of utilizing all payable byproducts. The management is excellent, in all departments, and the success of the company is due neither to good fortune, or chance, but to an effective combination of financial ability with high technical skill.

MOUNT MOLLOY, N. L.

NEW SOUTH WALES

Secretary and head office: J. Gainford, 18 Bridge St., Sydney, N. S. W. Brisbane secretary, C. E. Morton, 373 Queen St.; Adelaide secretary, Bristowe & Co., Brookman's Bldg, Grenfell St.; London secretary, E. Habbn, Palmerston House, Old Broad St., E. C. Mine office: Mt. Molloy, Heberton, No. Queensland. C. Caird, J. North, J. Vicary, W. Tilley and S. Pearl, directors. Organized Sept., 1912, as a reconstruction of the Mt. Molloy, Ltd., capitalization £150,000, shares £1 par.

Property, the Mount Molloy and Mount Cardwell mines, a limestone quarry, midway between Molloy and Bihoohra, and a government concession of 36 square miles, shortly north of the Mount Molloy mine.

The Mount Cardwell mine, at Nymbool, Cardwell county, but slightly developed, carries ore of 1.5 to 2% copper tenor, disseminated in iron ore, constituting a very desirable cupriferous flux.

The Mount Molloy mine, 70 acres, has a wide vein carrying ore shoots of zinciferous chalcopyrite. The mine has 6 shafts, No. 5, the main shaft, being 475' deep, with bottom level, at 470'. The 190' level of the mine proved disappointing, showing a wide vein low in copper contents. The 270' level is the best in the mine, carrying a considerable quantity of ore of excellent average grade, there being a 17' vein carrying a 5' paystreak of high-grade sulphides, with balance of 12' consisting of low-grade cupriferous pyrite. The 370' level shows a decrease in both quantity and quality of ore. The mine was estimated Dec., 1912, to have reserves of about 24,000 long tons of ore of about 3% copper tenor.

Equipment at No. 5, the main shaft, includes a substantial boiler house and engine house, with a first-motion hoist and a 16-drill Thompson air compressor. There is a 20,000-gal. underground tank, holding water for boilers and the water jackets of the blast furnace. The company owns a sawmill at Mareeba.

The smelter has a calcining furnace, reverberatory furnace, and one

36x90" water-jacket blast furnace. Matté is taken from a storage hearth to the converter department, which has 1 stand with 72x84" shells of barrel type, turning out converter bars of 99% average copper tenor. The power plant at the smelter has 3 boilers aggregating 350 h. p. and 7 engines aggregating 300 h. p.

Transportation is furnished by a 20-mile railway line, of 42" gauge, laid with 45-lb. rails, from Bihooora to Mount Molloy.

Production by the old company was 3,093 tons of copper to end of 1908, when smelting was suspended, and new company is giving sole attention to development work.

MOUNT MORGAN EXTENSION CO., LTD.

QUEENSLAND

Secretary's address: J. J. Taylor, Charters Towers, Queensland, Aus. Mine office: Mount Morgan, Raglan Co., Queensland, Aus., Thos. Lester, manager. Organized 1907, as successor of Sugar Loaf Gold Mining Co. Property adjoining the Mount Morgan Gold Mining Co., Ltd., has been explored by extensive diamond-drill borings to considerable depth, property being thought by the management to carry the extension of the copper-gold orebody of the Mount Morgan. Development is by a 651' incline shaft and a new vertical shaft in quartzite, that was 1,620' deep, May, 1913. Equipment includes steam power and a hoist, and the company was developing with a small force at the end of 1913.

MOUNT MORGAN GOLD MINING CO., LTD.

QUEENSLAND

Secretary's address: H. Woodd, 216 Quay St., Rockhampton, Queensland, Aus. Branch offices: 118 Pitt St., Sydney, Aus., and 9 Gracechurch St., London, E. C., Eng. Mine office: Mount Morgan, Raglan Co., Queensland, Aus. R. G. Casey, general chairman; R. S. Archer, chairman local board; Kelso King, chairman Sydney board; W. G. Thompson, H. Perrier, W. K. D'Arcy, W. F. D'Arcy and E. V. Reid, directors; John Jenkin, London sec.; Jas. S. Spark, Sydney sec.; B. Magnus, gen. mgr.; C. H. Humphreys, asst. gen. mgr.; Lewis Westcott, mgr.; A. A. Boyd, mines supt.; N. F. White, chief engr.; J. W. Moule, smelter supt.

Organized Oct. 1, 1886, under laws of Queensland, capitalization £1,000,000, shares £1 par; fully issued, and fully paid. Profits, for fiscal year ending May 31, 1912, were \$257,998. Profits for half-year ending Nov. 30, 1912, were £253,126, and after payment of dividends, surplus was £219,000. Dividends, paid quarterly, have ranged from a minimum of 8d., at the beginning, 1886, to a maximum of £1 2s., in 1889. To end of 1910 the company had paid about 725% in dividends, which were 6s. yearly, 1892-97; 6s. 6d. in 1898; 7s. yearly 1899-1900; 5s. 10d. in 1901; 5s. 9d. in 1902; 3s. yearly 1903-06; 4s. 3d. yearly 1907-08; 4s. yearly 1909-12. Company is second only to the Broken Hill Proprietary among the dividend paying mines of Australia. Accounts are made up to end of fiscal year, May 31, and submitted at Rockhampton in July, and half-yearly statement to Nov. 30, is submitted in December. Company controls, through stock ownership, the Electrolytic Refining & Smelting Co., of Australia, Ltd.

Actual financial conditions for year ending May, 1913, are stated to be: Revenue, £1,140,052; expenditure, £738,923; depreciation, £49,414; net profit, £351,715; dividends, £200,000; surplus, £520,325.

The company holds the Many Peaks mine under a lease irrevocable by the owners, but which may be terminated, on 6 months' notice, by the Mount Morgan, under a royalty of 2s. 6d. per long ton of ore extracted. This property is described under title of its owner, the Many Peaks Copper Mining Co., Ltd.

Lands, 90 acres perpetual leasehold, 80 acres leasehold, and 640 acres freehold. The company exchanged its freehold gold properties for govern-

ment leases, about 1894, and pays a royalty of 1s. per oz. on gold extracted. The property is about 25 miles west of Rockhampton, and the mine has been, since 1890, one of the greatest gold producers of the world.

The company has set out to acquire other properties with the idea of prolonging its corporate existence many years beyond present limits, and is also developing about 7,000,000 tons of low-grade ore in its present property, said to assay 2% copper and about \$4 gold per ton.

The Mount Morgan gold deposit proved to be the silicious gossan of a mammoth copper deposit. The ore showing increased copper values at depth, the company wisely began extensive diamond-drill borings, which proved an immense tonnage of copper ore. The mine, while a single mammoth property, has been operated as 2 connected mines, the upper section being worked opencast. The oxidized ores were exhausted 1910, and only sulphide ores are now mined. The sulphide gold ore is known locally as mundie, being an auriferous and slightly cupriferous pyrite.

Underground development comprises 2 principal shafts, known as the Main shaft, of 1,050' depth, and the Lynda incline shaft, about 1,500' deep. This shaft is 6' 6"x13' 9", being the largest cross-section of any shaft in Australia. Underground ore extraction is mainly from the 650' and 850' levels. An upcast air shaft, for ventilation, in the northwestern end of the mine, connects all levels. Depleted stopes are filled with mullock, on the pigstye system, some of the stopes being of mammoth size, No. 1 chamber, on the 750' level, having a first floor, 60x400' in area. The ore being strongly pyritic, is liable to spontaneous combustion, and a fire, 1909, was walled off by brick bulkheads and dams and extinguished by flooding the affected workings. Miners are taken to and from work on safety man trucks. The mine shows auriferous copper ore reserves, given May, 1913, as 1,365,000 long tons, averaging 3.5% copper and 10 dwts. gold per ton, and 1,982,000 long tons averaging 2½% copper and 5 dwts. gold per ton, with considerably larger quantities carrying 2 to 3% copper and 1 to 2 dwts. gold per ton, all of which should be available for later extraction. The mine's output for year ending May 31, 1913, was 224,385 tons including 203,777 tons of 3.41% copper ore, carrying \$9.50 per ton gold and 9,895 tons gold ore, carrying 2.66% copper and \$18.93 per ton gold.

In 1912-13, 99,022 tons limestone were mined at the Marmor quarry, and the smelter is supplied with iron ore from Iron island, 1 of the Duke group of the Northumberland islands.

Power equipment includes a central plant having four 400-kw. Parsons turbo-generators, 2 hoists, and several air compressors, including a 20-drill Bellis-Morcom 2-stage air compressor with intercooler and cross-compound steam cylinders. The boiler house is equipped with 250-h. p. Babcock & Wilcox multitubular boilers, with chair grate, mechanical stokers and superheaters, the boiler house having a 145' octagonal smokestack of 8' diameter at the top. The boiler house has 1,400-ton coal pockets, and an electric elevator for raising coal to the boiler house bunkers.

Buildings include necessary shops, offices and warehouses, the mine, mills, smelter and power plant occupying a single site. At the portal of the Lynda tunnel there is a 30x100' changing house, having shower baths and 504 lockers. In connection with the power plant there is a firewood storage flat of 5,000 tons capacity, at the west works, with rail connection, and a government railway line connecting Mt. Morgan with the Dawson coal mines.

The district being arid, extensive dams have been built for water storage, there being 7 dams, of which 5, in commission, have an aggregate capacity of 387,000,000 gals., No. 7 having a capacity of 270,000,000 gals.

Gold ore was treated in the mills by chlorination and also furnished about 500 long tons yearly of copper precipitate, of about 60% copper tenor.

The new management is installing 1913, a 500-ton concentrator to cost £50,000, built on the site of the old Mundic works, now dismantled. Experimental work at a small plant proved that fine grinding is necessary and the new mill is based on this work.

The copper smelter, built at a cost of nearly £250,000, and blown in, Jan., 1906, with a third furnace added, early 1908, and a fourth furnace, installed late 1910, giving the works a daily capacity of about 900 long tons, has been patched up to permit pyritic or semi-pyritic smelting, but is to be replaced by an entirely new plant in process of erection 1913, and expected to blow in, March, 1914. The blast furnaces are 48x190" at the tuyeres and the smelter has extensive storage bins for ore, fuel and fluxes. The furnaces have large stationary circular forehearth, replacing the small rectangular movable forehearth formerly used. Matte is made in 2 fusions. Owing to corroded jackets, from bad water, a system of launders and settling tanks for the circulation of water has been installed. Blast for the furnaces is supplied by 4 electrically-driven Connorsville blowers. The blast-furnace building also has a single reverberatory furnace, reducing flue dust to matte of about 20% copper tenor, which is sent to the blast furnaces for a second fusion.

In 1913, the smelter treated a total of 322,098 tons of ore of which 353 tons were purchased; 88,396 came from the Many Peaks mine, 9,677 were miscellaneous products, and 223,672 tons came from the Mt. Morgan mine itself. Converter product is blister copper averaging 98.6% copper and 12.5 to 15 oz. gold per ton, sent to the Port Kembla refinery.

The gold refinery is 78x142' in size, with concrete walls and is equipped with a 12x38' 6" furnace for burning off dross, after which the residue is fluxed and melted in two 5x8' reverberatory furnaces. In the center of the building are 4 pot furnaces, 8' in diameter and 3' deep, for gold bullion. The refinery has an 8x12" Dodge crusher and 14" rolls for handling slags. The strong room for refined gold bullion is built of reinforced concrete, with walls 12' high and 19' 6" thick.

Forces have averaged 2,500 men for many years past, and are to be increased 1914, to about 3,300 men. Ore is broken mainly on contract, this system proving very satisfactory to both employer and employee. The company is very generous in the treatment of its workmen, giving liberally for educational and charitable purposes, and in consequence, has a force of maximum efficiency, with a minimum of friction.

Recent production has been as follows, for fiscal years ending May 31: 257,600 lbs. fine copper and 122,280 oz. gold in 1905; 5,760,458 lbs. copper and 120,606 oz. gold in 1906; 9,154,880 lbs. copper and 145,138 oz. gold in 1907; 12,456,640 lbs. copper and 153,092 oz. gold in 1908; 12,989,760 lbs. copper and 138,342 oz. gold in 1909; 15,818,880 lbs. copper and 178,867 oz. gold in 1910; 15,619,520 lbs. copper and 142,449 oz. gold in 1911; 16,665,600 lbs. copper and 134,575 oz. gold in 1912. For the year May 31, 1913, the company treated 322,098 long tons of ore yielding 9,280 long tons or 20,787,200 lbs. fine copper and 118,488 oz. fine gold. The Mt. Morgan is a fine copper-gold mine, well managed and highly profitable.

MOUNT ORANGE MINING CO.

QUEENSLAND

Office and mine: Mackay, Carlisle Co., Queensland, Aus. Organized about 1908. The mine carries carbonate and sulphide ores, low in silica, and as smelted averages about 15% copper, 6 oz. silver and 0.5 dwts. gold per long ton. The smelter has only a 9-ton reverberatory furnace, making a

first fusion matte of 40 to 50%, and a second fusion matte of 60 to 75%, copper tenor. Idle since 1910.

MOUNT OXIDE MINES, LTD. (N. S. W.).

QUEENSLAND

Office: Sydney, N. S. W. Mine office: Mt. Oxide, via Cloncurry, Queensland, Aus. Sir Albert Gould, K. C. M. G., pres.; J. E. Cocker, sec.; other directors: F. Bacon, G. Allen and T. B. Birbeck; Gerard W. Williams, mgr.; J. D. Henry, supt. Organized July, 1912, under laws of New South Wales, capitalization £200,000, shares £1 par; issued £170,000 Debentures, £30,000 at 6%. Company has sold its holdings to and will exchange its shares for those of a new company of the same name, organized Sept., 1913, in London, which company will have ample funds to place mine on a paying basis.

MOUNT OXIDE MINES, LTD.

QUEENSLAND

Registered in London, Sept., 1913, capitalization £500,000, shares £1 par. Company is to pay off debentures of the Queensland company of the same name, to provide £80,000 capital for mine development, and £400,000, if needed, for construction of a 70-mile railway to Mt. Cuthbert. Company will exchange shares with the old company, share for share.

The flotation is based upon a report by Mr. Gerald Williams, that the mine has 50,000 tons of 24% and 60,000 tons of 10% copper ore developed, valued at nearly \$5,000,000, all above the 300' level.

Lands, 150 acres, leasehold, in the Cloncurry district. Country rock is slate, or graphitic schist, probably of Silurian age. Orebodies occur in shear zones having a dip of about 70°. The ore is mainly chalcocite, with surface showings of atacamite, azurite and malachite.

Development to 300' depth includes 3 shafts of 110 to 308', and a 518' adit tunnel, a total of about 1,000' of workings, mainly on the 152' and 300' levels, where the glance streak averages 4' in width, but expands to a maximum width of 12' in a winze 50' below the adit level. The mine has no power equipment and development work is further hampered by scarcity of labor. The property was reported on by J. H. Fawcett and by G. A. Richard, 1912.

MOUNT ROYAL MINE.

NEW SOUTH WALES

Mine office: Dandaloo, Narramine Co., N. S. W., Aus. Mine about 20 miles west of Dandaloo, in the Orange Plains field, has 2 shafts, No. 1 of 300', with about 500' of workings, showing a considerable body of oxidized ores, and chalcocite assaying up to 40% in copper tenor. Has a smelt r, with 1 small reverberatory furnace, and was making about 30 tons of matte, of about 48% copper tenor, monthly, during spring of 1913.

MT. WARMINSTER LEAD & COPPER MINE, LTD. QUEENSLAND

Office: 166 Bolsover St., Rockhampton, Queensland, Aus. Mine office: Mount Chalmers, Rockhampton Co., Queensland, Aus. H. Eustace King, chairman; Wm. Thompson, sec., at last accounts. Lands, 125 acres, 80 acres freehold, 1 mile N. W. of the Great Fitzroy mine, and 10 miles from Rockhampton. The mine has 2 shallow shafts and a short tunnel, latter showing a 12' vein carrying oxidized and sulphide ores of about 2% copper tenor, from which 23 tons of 20% selected ore was shipped 1907, to the Waratah smelter. The Mt. Warminster mine is idle and company was preparing to turn this property over to leasers at last reports. The company also owns the Britannia gold mine, on the Canoona gold field, said to carry ore averaging 6 dwts. gold per long ton.

MOUNTAIN OF LIGHT MINE.

NORTHERN TERRITORY

Mine address: Leigh Creek, Northern Territory, Australia. Property, 2 miles S. E. of Leigh creek on the Great Northern railway, shows

clay-slates and sandstone with interstratified bands of kaolinized matter, copper-bearing quartz veins and bands of ferruginous quartzite.

Considerable work has been done to shallow depths, and several thousand tons of ore have been taken out. The veins are generally 3 to 4' in width, and carry seams of azurite and malachite, with bunches of tetrahedrite and tenorite, down to a depth of 60'. Diamond drilling was begun May 7, 1912, by the Government, in a line parallel with the strike of the formation, and the first hole was expected to intercept the vein at about 400' from surface.

MOUNTAIN RUN MINE.

NEW SOUTH WALES

Office and mine: Rockley, Bathurst Co., N. S. W., Aus. R. S. Garbutt & Co., owners. Company owns the Mountain Run mine, 12 miles from nearest rail station, discovered 1895, and the Sugar Loaf mine, discovered 1899. The property has 2 veins in schist and slate, the main vein of about 6' average width carrying about 3' of chalcopryite assaying 6 to 12% copper and 1 to 2 oz. silver per long ton, with a trace of gold. The Sugar Loaf mine yields iron ore, used for fluxing.

Equipment includes steam power, with a hoist. The smelter has an 18-ton water-jacket blast furnace, practice of which was so poor that, during a campaign from March to Oct., 1907, smelting 1,400 tons of ore, the yield was only 78 tons of matte of 25 to 50% copper tenor, an absolutely unpayable return. Property developing in 1913, shipping 12 tons of 10% ore in July.

MOURAMBA COPPER MINES, LTD.

NEW SOUTH WALES

Secretary's address: H. A. McMahon, Winchester House, Old Broad St., London, E. C., Eng. Mine office: Hume, Mouramba Co., N. S. W., Aus. A. E. Barton, A. E. Fuerst and C. J. McMahon, directors. Organized Feb. 8, 1910, under laws of Great Britain, capitalization £20,000, increased June, 1910, to £35,000, and again increased April, 1912, to £100,000, shares 10s. par.

Lands, 260 acres, including the Shuttleton and Crowe Creek mines, opened by shafts of 450' and 730' respectively. No recent returns secured.

MOUZAÏA; SOCIÉTÉ ANONYME DE.

ALGERIA

Office: 5 Rue St. Vincent de Paul, Paris, Xe., France. Mine office: Camp des Chenes, par Blida, Alger, Algeria. E. Raschlé, pres.; R. Lava, sec.; M. Duvalard, gen. mgr. Organized Oct. 16, 1890, under laws of France, capitalization f350,000, shares f100 par.

Lands, 5,362 hectares, having 6 fissure veins, in schists, carrying chalcopryite, and 10 contact veins carrying antimonial gray copper. The veins range from 2cm. to 1m. in width and average 4 to 5% copper, and from nothing to 27 oz. silver per ton. Mine is opened by a 17m. shaft and shows chalcopryite ore in 7 tunnels of 39m. to 63m. length, and gray copper ore in 12 other tunnels, longest 265m. Property is but a mile from the West Algerian railroad. The copper properties have been idle since 1899, though the company has opened up large bodies of hematite and spathic iron ore, estimated to contain 4,200,000 metric tons of ore of merchantable grade.

MOZAMBIQUE CO. (COMPANHIA DE

MOÇAMBIQUE).

PORTUGUESE EAST AFRICA

H. D. Hodgkinson, sec., 13 Austin Friars, London, E. C., Eng. Head office: 45 Rue d'Alcirim, Lisbon, Portugal. Austin King, director of mines, Macequede. Incorporated March 8, 1888, given royal charter Feb. 11, 1891, and reconstituted May 5, 1892. Capitalization £1,500,000, shares £1 par; fully issued and paid. Paid a 5% dividend in 1911. Reserve fund £16,257.

Company practically owns and exercises governmental functions over

the whole of the land, mines and produce of 60,000 square miles in the central and richest part of Portuguese East Africa, adjoining Rhodesia. The Manicaland goldfield, or mining district, covers the main mineralized portions of the territory and lies within a radius of 16 miles about Macequece, the district being a part of the Umtala field of Rhodesia. It shows a belt of schists bounded north and south by granite with irregular intrusions of diorite largely altered to serpentine and traversed longitudinally by ledges of ferruginous quartzite paralleling the gold quartz reef. Copper ore occurs and is worked by the South African Copper Trust in the Edmundian and Manica mines. (See descriptions under that title.) Copper also occurs in Mossurise and the Umkondo copper mine is working south of Melsetter, near the frontier.

The company offers prospectors a 12-months' license for £1, with the right to locate (peg off) 10 claims of 100 meters square, which must be registered, and within 12 months thereafter opened by 66' of development work on a group of 10 or less claims, or 6' 7" on each claim, or in lieu thereof pay \$2.40 per claim for an inspection certificate good for 12 months. Claim rents, like those of the Transvaal and Rhodesia start the second year at \$2.40 per claim and increase 50% each succeeding year. Royalties amount to 10% of the net profits, except for gold, for which a graduated scale from 1 to 4% is provided for production less than 800 oz. per month, and 10% for over that amount.

MUNGANA MINING CO., LTD.

QUEENSLAND

Office: 31 Queen St., Melbourne, Aus. British office: Palmerston House, Old Broad St., London, E. C., Eng. Mine office: Mungana, North Queensland, Aus. D. W. Harvey Patterson, chairman; H. F. C. Keats, E. A. Weinberg, V. J. Saddler and John L. Wharton, directors; John Brandon, sec.; Edwin Habben, London sec.; E. J. J. Rodda, mine mgr.; Fred Back, supt. Organized April 1, 1912, under laws of Queensland, as successor of Mungana (Chillagoe) Mining Co., Ltd., capitalization £150,000, shares 6s. par; fully issued and fully paid. Shares are listed on the London, Melbourne, Sydney and Adelaide stock exchanges. Annual meeting, in July.

Lands, 286 acres, held by 6 leases for 50 years from Jan., 1898, at annual rental of £1 per acre, about 10 miles west of Chillagoe, in the Walsh and Tinaroo district. Property includes the Giroffa and Lady Jane mines, showing "cave" or replacement deposits of lead and copper ore mostly oxidized in limestone of Middle Devonian age, alongside of crystalline schists.

The 7 orebodies known occur along an E.-W. direction and are nearly vertical. Two deposits are worked, the largest, the Giroffa, being 70' wide and 200' long, and averaging 1% copper, 12% lead, 7% zinc, and 9 oz. silver per ton.

Development consists of the 730' Giroffa, 460' Saddler, 330' Saddler No. 2, 150' Dorothy, 200' Dorothy No. 2, and 200' Calumet shafts.

The Giroffa mine, worked continuously since 1900, has a good surface showing, with a large orebody in limestone. Development is by a large open-cut, stripped to depth of 50', and a working shaft 730' deep. The mine shows considerable ore assaying up to 8% in copper tenor, but is primarily a silver-lead mine, values in order named being in silver, lead and copper. A new lens of high-grade ore 60x100' was cut on the 710' level in Sept., 1913. Reserves estimated at 70,000 tons blocked out for stoping, or 120,000 tons developed. Timbering is by square sets, and the mine is very wet, giving considerable trouble in sinking, at times.

Equipment includes 500-h. p. steam and 35-h. p. electric plant, 2 hoists good for 1,000', 15-drill air compressor and 16 various buildings.

The Lady Jane mine has met with a series of misfortunes, losing its old

main shaft through drawing, this being replaced by the Saddler shaft, 100' west of the old Lady Jane No. 3 shaft, of 4' 6" x 15' 9" size, inside measurements, with 4 compartments, sunk to depth of 426'. A fire broke out 1909, and continues burning, and the mine is now being flooded up to the 322' point. Production of ore for fiscal year ending June 30, 1912, was only 535 tons.

Minor properties, apparently all idle, are the Griffiths, having an 80' opencut, and the Magazine, having an 83' shaft and an opencut.

Buildings include a general workshop, with other necessary mine structures. There are tanks holding 48-hours' water supply, at each mine, with waterworks for the town, giving fire protection to the buildings. The property is served by the Chillagoe to Mareeba railway. Fuel is cord wood. Ore production is shipped to the Chillagoe smelter, for reduction.

Gross output to end of March, 1913, amounts to 237,885 tons of ore yielding 23,102,977 lbs. fine copper, 2,628,800 oz. silver and 35,144 tons pig lead. Production was 30,275 long tons of ore, yielding 2,719,360 lbs. fine copper, 6,657,360 lbs. lead and 298,505 oz. silver, in 1907; 24,814 long tons of ore, yielding 2,925,440 lbs. copper, 3,178,560 lbs. lead and 306,640 oz. silver, in 1910; 12,847 long tons of ore, yielding 357,932 lbs. copper, 3,812,480 lbs. lead and 91,890 oz. silver in 1912.

MÜNSTERSCHE GEWERKSCHAFT.

GERMANY

Idle. Office: Mozartstr. 16, Düsseldorf, Germany. F. Bonnnütter, gen. mgr.; Fr. Wilh. Lührmann, supt., at last accounts. Property includes the Nassau mine, near Steinbach, and the Stahlberg mine near Rimbach, carrying iron and copper ores, both in a development stage.

MURCIA COPPER & IRON MINES, LTD.

SPAIN

Office: 14 Bedford Row, London, W. C., Eng. Sir G. W. Kekewich, K. C. B., H. Godefroi and H. H. F. Hyndman, directors. Organized Aug. 21, 1912, capitalization £60,000, shares £1 par.

Property comprises sundry copper and iron mines in the vicinity of Blanca, Murcia, Spain.

MUREX MAGNETIC CO., LTD.

ENGLAND

Secretary and offices: G. K. Radcliffe, Baltic House, Leadenhall St., London, E. C., Eng. Hon. L. Holland, chairman; W. C. Bond, managing director; A. Stewart, M. R. A. Samuel, W. J. Loring, directors. Theodore E. Hoover, cons. engr. Organized April 15, 1909, under laws of Great Britain, to acquire British rights to the patents of the Murex Syndicate, Ltd. Capitalization £210,000, shares £1 par, issued 193,493 shares. Company paid £89,993 in fully paid shares and 60,000. 10s. paid to the Murex Syndicate and in 1912 the remaining rights of patent for all other countries were acquired for £90,000.

The value of the process is reported to have been proven successful at the Cordoba copper mines, Spain, Whim Well copper mine in Western Australia, in treating the lead ores of the Grund mine, Harz district, Germany, and at the Malines Co.'s mines in France.

The company is inadequately financed and a reorganization is proposed, the new company to have a nominal capitalization of £70,000, shares 5s. par, exchangeable share for share in the old company (one £1 old share for a new 5s. share), the new company to take over the undertakings and pay off all liabilities.

MURRAY'S REWARD MINE.

TASMANIA

Office: Mt. Balfour, Russell Co., Tasmania. W. Murray, manager. Property shows banded slates dipping 80°, with a good outcrop of leached ore at surface, supposedly succeeded by a zone of secondary enrichment at water level. The lode is a complex network of many quartz stringers

carrying ore shoots, 3 to 9' wide. Ores contain covellite with a little chalcocite, forming veinlets, traversing the lode. The footwall is quartz carrying unreplaced slate fragments and veinlets of chalcopyrite, pyrite and covellite.

Development is by 3 tunnels, none of which give great depth, and a number of shallow shafts, deepest 100'.

Production to June, 1910, was 1,286 tons ore valued at £16,000, and in 1911 amounted to 2,083 tons ore valued at £21,367.

MURTEGA MINERALS CO., LTD.

PORTUGAL

Secretary's address: C. V. Jones, 139 Cannon St., London, E. C., Eng. Letter unclaimed at former mine office, Barrancos, Alemtejo, Portugal. J. Dunham Massey, chairman. Organized Dec. 8, 1900, under laws of Great Britain, capitalization £80,000, shares £1 par. Lands include 7 old copper mines in the district of Beja. Company endeavored to open a mine at the presumable point of intersection of 3 main veins, in the center of a hill, under a promising gossan, by shaft and tunnel. Company comatose and mine inactive for several years past.

MUTOOROO COPPER & SILVER MINING CO., LTD.

SOUTH AUSTRALIA

Office: Hindley St., Adelaide, South Australia. Mine office: Mutooroo, South Australia. J. P. Winch, manager.

Property, 320 acres, leasehold, 14 miles S. W. of Cockburn, showing limestone intruded by igneous rocks, with contact deposits carrying lenticular orebodies of considerable size. The ores carry cuprite, malachite, azurite, chrysocolla and atacamite in the oxidized zone, succeeded at depth by chalcocite, bornite and chalcopyrite, associated with pyrite. Mine is developed to shallow depth only. Average assay of 2,517 long tons of ore extracted, 1896-9, was 6.58% copper. Equipment includes a small precipitation plant. Mine was let on tribute, at last report, to Critchley & Co.

NABABEEP MINE.

CAPE PROVINCE

Owned by Cape Copper Co., Ltd., at O'okiep, Little Namaqualand, Cape Province.

NACKARA PROP. COPPER MG. CO., N. L.

SOUTH AUSTRALIA

Probably closed down. Letters to Nackara, Herbert Co., South Australia, unanswered. To end of 1909 company had received subsidies of £100 from the South Australian government, and had repaid nothing. Lands, formerly known as Robertson's mine, 4 miles from Nackara, have a fissure vein traversing argillaceous and calcareous slates and sandstone of 2 to 4' width, with a 6 to 12" hanging-wall paystreak giving assays of 7 to 25% copper, from a trace to 3 oz. silver and up to 1 dwt. gold per long ton. Mine is developed by 220' main shaft, with 4 shallower shafts, in a distance of 400'.

NALTAGUA; SOCIÉTÉ DES MINES DE CUIVRE DE.

CHILE

Main office: 5 rue de Helder, Paris, France. Mine office: El Monte, Chile. Baron Emmanuel Leonino, M. E., chairman, 7 rue Euler, Paris; Max Lyon, M. E., managing director, 83 Avenue du Bois du Boulogne, Paris; J. de Bethman, A. Boscher, Chas. Chalupt, A. de Dietrich, P. Keller, E. Leonino, A. de Mun, Jorge Matte, A. de Montureux, G. Renevey and B. de Senevas, directors; Maurice Clère, mgr.; Henry Salomon, sec.; Count Bernard de Saint-Seine, smelting engr.; J. Grunberg, smelter supt.; A. Fraysse, C. Lehman, L. Weyl, mg. engr.; Pretot, Fontaine & Co., Valparaiso, purch. agts.; Ledoux & Co., New York, chemist assayer.

Organized Jan. 26, 1907, under laws of France, capitalization f10,000,000, in 100,000 shares, par value f100. Bonds or debentures authorized, f3,000,000, with 5% interest. Total assessment to date, f3,000,000. Net profits in 1909-10, f36,000; in 1910-11, f195,000; in 1911-12, f595,000, giving

total of \$826,000. Has paid no dividends to date. Interest on bonds paid and drawn bonds repaid. Fiscal year ends June 30.

The company owns the properties formerly held by the *Compania Minera de Naltagua*. Holdings comprise 184 *pertenencias* of mineral lands, and the farm *Naltagua*, with a total of nearly 2,000 acres. The country rock is porphyry, with a succession of parallel mantos, or blanket veins, some in limestone and porphyry. These bedded veins have a known length of about 10 kilometers, and are said to average 4% copper. Development work was begun July 1, 1907, and the 6 years' work amounts to about 9 miles. The 7 principal mines are the *Rosario*, *Vacas*, *San Ramon*, *Los Ranchos*, *Carmen Alto*, *Venus* and *California*.

The *San Ramon* mine, thus far the principal producer of the company, has a 3 to 10' vein averaging $7\frac{1}{2}\%$, running north and south, carrying oxidized ores to 65' depth succeeded by *bornite* changing downward into disseminated *chalcopyrite*. The ore carries 1.5 to 4.5% copper as mined and is self fluxing, requiring only a little *pyrite* to give a 50% matte. The mine is developed by tunnels with a back of about 50 meters. The underground workings aggregated 1,200 meters July, 1912. Mining costs at this mine are 18 pesos per metric ton, for ore delivered at the smelter.

The *Vacas* mine, near *San Ramon*, has somewhat similar but leaner ore, though the bed is not so thick and has a calcareous gangue.

The *Ranchos* mines includes the *Gato*, in which a 6' vein of 4% ore in porphyry has been opened for stoping in 1913. The *Carmen Alto* mines have a large amount of ore blocked out in 2 veins which will be mined when a 700-meter tunnel is completed connecting the district with the railway line.

Owing to development being exclusively by tunnel, the mines have no hoists. There are two 3-drill *Ingersoll-Rand* air compressors. The company plans a 2,000-h. p. hydro-electric installation on the *Rio Maipó*. There is abundant wood for fuel on the *Naltagua* ranch.

Transportation include several aerial trams and a private railway line. The *Bleichert* aerial tram, from *El Monte* to *San Antonio*, where the tower station is located, is 5,600 meters in length, with 22 towers, of 22 meters maximum height, on concrete foundations, having greatest span of 386 meters, with fixed rope of 35-mm. and movable rope of 15-mm. diameter. An incline tram, at *San Antonio*, connecting with the lower station of the aerial tram, is 300 meters long, at an incline of 30° , having a double line of rails. A $2\frac{1}{2}$ -kilometer railway connects the incline tram with the private rail system, which has a total length of 14 kilometers, with maximum grade of 5% and gauge of 600-mm. Equipment includes 3 electric locomotives, with 2 and 3-ton ore cars made up into trains of 12 cars.

The 300-ton smelter, $2\frac{1}{2}$ miles from *Naltagua*, in the valley of the *Rio Maipó*, adjacent to the *Rio Mapocho*, is 70 kilometers by river to the coast, and 225 kilometers to *Valparaiso*, with a freight rate of 6 pesos per ton to the latter point. The smelter was blown in, 1909. Equipment includes two $40\times 120''$ blast furnaces. Slags, assaying about 0.4% copper, are granulated, and sluiced to the dump by water.

The converter department has 3 stands, with 9 shells of the *Copper Queen* barrel type, and an electric travelling crane, with a hydraulic accumulator for rotating the shells. Smelting and conversion costs are estimated at 15 pesos per metric ton.

The smelter power plant includes a 375-kw. engine, 2 *Connorsville* blowers and a 100-kw. air compressor for converter blast, furnishing air at 1.2 kgs. per cc. The boiler plant has five 200-h. p. boilers, and a 30-meter steel smokestack.

Forces are about 500 men at the mines and works, with average wages of 5 pesos at the mines and 4 pesos at the smelter.

Production for 1912-13, for 8 months ending Feb. 28, was 2,978,400 lbs., equivalent to 4,450,000 lbs. for the whole year. Past production has been as follows: 293,209 lbs. in 1908-09; 2,253,090 in 1909-10; 2,486,772 in 1910-11, and 4,082,892 lbs. in 1911-12. Above figures are for Chile bars carrying 99.3% copper.

NAMAQUA COPPER CO., LTD.

CAPE PROVINCE

Office: 3 Fenchurch St., London, E. C., Eng. Mine office: Concordia, Little Namaqualand, Cape Province. Sir F. J. Mirrielees, K. C. M. G., chairman; Thos. V. Anthony, Harry von Berg, Col. Frederick J. King, C. L. H. Loeffler and Wm. Rich, directors; A. W. Outram, sec.; S. F. Phillips, gen. mgr. and supt.; J. Garland, mine, supt.; C. H. Feldtmann, mill supt.; Fredk. Butler and J. Paul, elec. and mech. engrs.; L. A. Tait, chemist assayer.

Organized April 23, 1888, under laws of Great Britain, as successor of Namaqua United Copper Co., Ltd., capitalization £200,000, shares £2 par; issued, £188,662. The company has a surplus fund of more than £70,000, invested in British consols, etc., and has returned in dividends more than $3\frac{1}{2}$ times its capitalization. Largest dividends were 40% in 1889 and $37\frac{1}{2}$ % in 1912. Dividends were 30% in 1900; 15% in 1901; 5% in 1902; $13\frac{3}{4}$ % in 1903; 20% in 1904; 20% in 1905; 35% in 1906; $12\frac{1}{2}$ % in 1907; $12\frac{1}{2}$ % in 1910; 25% in 1911, and $37\frac{1}{2}$ % in 1912; total dividends to date, £7 3s. 6d. per £2 share. Profits for 1912 were £81,116, £77,264 available, compared with £59,148 available profits in 1911.

Lands, 750 acres, leasehold, held subject to the Cape Colony mining tax, the principal property being near Concordia, 5 miles N. E. of O'okiep.

The Tweefontein mine, 2 miles N. W. of Concordia, opened 1883, has high-grade chalcopryrite, occurring in intrusive greenstone traversing granite. This mine has 7 shafts, the 2 main shafts being No. 1, of 1,140' depth, with a 12x24" hoist, and No. 2 shaft of 950', which shows, perhaps, the most promising workings in the mine. The Tweefontein was said, by the Cape Colony government, 1909, to have an accumulation of more than 200,000 tons of rejected ore, estimated at 5% copper tenor. Ore reserves of the mine as a whole were estimated, 1912, at 106,500 long tons, containing 6,895 tons of fine copper besides 57,000 tons of slimes and tailings. The Tweefontein ore is screened and selected at smelter.

The Henderson mine, one-half mile from the smelter, is an old mine, flooded for years, but unwatered in 1912, and electrically equipped. On the 94' level, the vein, though narrow, carried a pocket of 7% ore, in which a winze was sunk; the No. 2 level at 180' by connecting with this will open new ore; 390' of work was done in 1912.

The Wheal Julia mine, shortly west of Concordia, has 3 shafts, but development work is suspended and stoping yielded but 105 tons of oxidized ore containing 4.02% copper, in 1912.

The Jubilee mine, formerly known as the Wheal Georgiana, about 1 mile west of Concordia, is said to have been opened by Governor van der Stell, A. D. 1685, and was again reopened by Col. Gordon and Lieut. Paterson, 1779. The Jubilee has 2 shafts.

Miscellaneous properties include the Prospect mine, with 2 shafts, closed down March, 1908; the Flat mine, with 1 shaft; the New East Centre mine, with 1 shaft, and the Hester Maria mine.

Transportation between the various mines and works is over an 8-mile tram line, built 1889, connecting with the Port Nolloth railway of the Cape Copper Co., Ltd., and operated by steam engines.

The main dressing floor is at the Jubilee mine. The smelter has 2 furnaces, burning coke, but considerable concentrated ore has been shipped to Swansea, for reduction. Buildings include necessary shops, a warehouse, office, stores, hospital, schoolhouse, library and dwellings for employes. The buildings are electric lighted.

Production has shown only slight changes during the past decade, having been 5,152,000 lbs. fine copper in 1900; 5,276,712 lbs. in 1905; 5,931,521 lbs. in 1906; 5,447,680 lbs. in 1907; 5,302,080 lbs. in 1909, secured from 46,000 long tons of ore treated; 5,900,160 lbs. in 1910; 5,050,000 lbs. in 1912 from 44,000 tons treated, averaging 7%.

Company plans continuation of diamond drilling in 1913, and improvements in concentration and precipitation plants.

NATIVIDAD; SOCIEDAD MINERA.

PERU

Mine office: Morococha, Junín, Peru. Nicolás Azalia, mgr.; Manuel Quintana, supt. Organized 1895, under laws of Peru and is controlled jointly, through stock ownership, by the Backus & Johnston Co. and the Morococha Co.

Property consists of the Natividad mine, which has been worked for the last 10 years on a very evenly mineralized vein carrying chalcopyrite, tetrahedrite and pyrite averaging 21.65% copper with 530 grams of silver per ton. Mine was drownded for several months in 1912, but is now pumped dry and the lowest level, No. 5, is ready for stoping. Ore is of a very desirable character for the Casapalca smelter and shipments of 1,500 tons per month will be made for the ensuing year. Past production is given in Vol. X.

NAUTANENS KOPPARFÄLT; AKTIEBOLAGET.

SWEDEN

In Nautanen, province of Lapland, Sweden. Company in liquidation, 1912-13.

NAVERSBERG FALUN COPPER MINES & WORKS, LTD.

SWEDEN

Reorganized as the Swedish Metals Extraction Co., and property described under that title.

NAZAROV & CO.

TURKESTAN

Mines and smelter at Naukat, near Kokand, Russian Turkestan. Property consists of 300 acres covering a deposit of native copper at Naukat, 15 miles west of the town of Kokand on the railway. The copper occurs in bedded sandstones, steeply upturned and interbedded with barren red clays and lean sandstone. The copper forms tiny grains, nodules and occasional lumps, but as a whole the bed does not average over 20 lbs. of recoverable copper per ton. The copper measures are traceable along the river Syr-Daria for 12 miles and show 10 distinct mineralized layers varying from 3 to 10' in thickness. The development is as yet but slight, though 1 inclined shaft has reached a depth of 280'. The sandstones are crushed and crumbly as a result of their uplifting so that mining can be done with little powder. The workings follow fault zones since the richer ores are found along the side of such faults.

A 600-ton concentrator has been erected at the mine and is reported to do excellent work. It is equipped with trommels, classifiers, jigs and Wilfley tables. The ore is discharged onto a 3" screen, drops into the trommels, where it is broken up sufficiently to be sent to the classifiers.

The property is idle at present owing to want of capital, since it must be worked on a large scale to be profitable.

NEDRE MIDDAVARRE KOBBERGRUBER

NORWAY

Office: Bodö, Norway. Mine office: Lurfjorden, Kvanangen, Tromsö, Norway. Property is reported, by the Norwegian government, to be working on a small scale, 1912.

NERVA, S. A.; MINAS DE COBRE DE.**SPAIN**

Office: Madrid, Spain. Mine address: Valverde del Camino, Huelva, Spain. Sr. Don Andrés Mellerdo, pres.; Marquess de Portago, vice-pres.; R. Sanchez Ocaño, sec.; J. J. C. Fernan, gen. mgr.; Miguel Higuera y Martínez, engr.; Chas. Hansen, smelter supt. Organized April, 1907, under laws of Spain, capitalization 20,000,000 pesetas, in 250,000 shares of 50 pesetas par, fully paid, and 15,000 shares of 500 pesetas par in deferred stock. Dividend rate is 4% for 3 years on the preferred shares. Company reports 3 dividends of 2 pesetas each for 3 half-years ending Dec. 31, 1907, amounting to 750,000 pesetas.

The company owns the property formerly held by Arenillas Copper Mines, Ltd., liquidated 1904. This includes the Chaparrita group, in the commune of Nerva, and the Ratera or María Concepción group, 3 kilometers from Valverde del Camino, and 8 miles from a railway station. The ores are cupriferous pyrite, said to average 3.5% copper, and occur at the Ratera mine in a narrow orebody, with quartz gangue, carrying lead and arsenic. Mining equipment includes a 250-h. p. steam plant, and mine is served by its own 5-mile branch railway to Buitron.

The works, 2 miles from the mine, covering 843 square meters, and 48' in height, are in 3 sections, 1 for boilers, 1 for machinery, and 1 for the smelter. The 200-ton smelter has two 36x84" water-jacket blast furnaces, with a settler, making matte of about 45% copper tenor. The converter has a 15-ton electric traveling crane and hydraulic accumulator, with 1 stand, turning out blister copper of 98% copper tenor.

The engineers reporting on the property when the company was organized recommended a reduction of the capitalization, and advised the company to give up the Chaparrita and La Fé mines as of little value; to develop the Ratera, Chinblon and Sibelle mines and close down the smelter.

NEU-GLÜCK; GRUBE.**GERMANY**

Mine address: Volperhausen, Rheinprovinz, Prussia, Germany, Ernst Jüngst, general manager. Property carries iron and copper ores, with annual production of about 3,000 metric tons, mainly of iron ore, secured with an average force of 15 men. Mine is opened by tunnel and owners plan to drive a second tunnel of 700 meters length, 45 meters below the present tunnel, to afford direct rail connection.

NEVILL, DRUCE & CO.**WALES**

Office: 4 Corbet Court, Gracechurch St., London, E. C., Eng. Smelter at Llanelly, Caermarthenshire, Wales. Property is the Llanelly copper works, built 1805, which do a custom smelting business.

NEW ALFRED MINES, LTD.**ENGLAND**

Idle. Office and mine: Boligney, Perranporth, Cornwall, Eng. A. J. Swaab and B. Reed, directors; F. Marshall, secretary. Organized March 31, 1909, under laws of Great Britain, capitalization £35,000, shares £1 par, as a reconstruction of Alfred Mines, Ltd. Property is the New Wheal Leisure mine, carrying copper and zinc ores.

NEW ANNIVERSARY MINE.**QUEENSLAND**

Closed down, 1912. Owned by Anniversary Copper Mines, Ltd., at Herberton, Cardwell Co., Queensland, Aus.

NEW CENTRAL SIBERIA, LTD.**SIBERIA**

Office: 155 Dashwood House, London, E. C., Eng. Company has abandoned its copper properties in Siberia and is now a gold-dredging company.

NEW CLARA ST. DORA MG. CO., N. L.**SOUTH AUSTRALIA**

Office: Mundy St., Port Adelaide, South Australia. Mine office: Alberrie Creek, South Australia. F. S. Chany, chairman and sec.; H. Duck, mgr. Organized March, 1898, under laws of South Australia, capitalization

£10,000, shares £1 par; issued £5,345, at last accounts. Is controlled, through stock ownership, by the English & Australian Copper Co., Ltd., and is said to have lost about £1,200 on operations.

Lands, 4 claims, 160 acres, formerly known as the Two Franks mine, 6 miles from a railway, in the Hergott Springs district, held under a 40-year lease. Property shows an orebody carrying malachite and chalcocite, occurring as nodules, in hard limestone, and as veins in soft limestone. Ores include native copper, cuprite and chalcocite, and ore shipped, presumably after careful hand selection, has averaged 26% copper, without gold or silver values.

Equipment includes a 38-h. p. steam plant, with hoist good for 400'. There is a small mill, with a crusher, one set of rolls, and one Mays jig. Company is a very small producer of high-grade copper ore.

NEW CLONCURRY COPPER & SM. CO., LTD. QUEENSLAND

Secretary and offices: B. F. G. Meldrum, 117 St. Vincent St., Glasgow, Scotland. R. L. Alston, chairman, and J. Coubrough, J. P., directors. Organized in Edinburgh, Oct. 29, 1895, as successor of the Cloncurry Copper & Smelting Co. Capitalization £3,300, shares 6s. par; all issued and 5s. paid. Dividend paid 1907, 15s. per share. Accounts for year ending Oct. 30, 1912, showed £768 debit.

Company sold entire holdings in 1906 for £2,000 cash, £20,000 shares in Queensland Exploration Co., Ltd., and £45,000 shares in the North Queensland Railway Co., Ltd.

NEW DISTRICTS DEV. CO., LTD. ARGENTINA & RUSSIA

Secretary and offices: Wm. Smith, 10-11 Austin Friars, London, E. C. Eng. T. H. Hamilton, chairman; E. Turk and L. Ehrlich, directors. E. T. McCarthy, cons. engr. Organized Aug. 15, 1912, as reconstruction of company of same name registered in Transvaal, 1904. Capitalization £200,000, shares 10s. par; 242,000 shares issued, fully paid, to stockholders in former company. Two 10s. shares in the English company were issued for every £1 share in the South African company.

Company owns an interest in the Magato grant, about 740 square miles, in Northern Transvaal and the following copper companies: Spassky Copper Mines, Ltd., Famatina Copper Co., and the Atbasar Fields, Ltd., the latter promising to become one of the largest copper producers of Russia. In addition to these holdings company owns large interests in coal mines, the H. D. Syndicate and other corporations.

NEW EINASLEIGH COPPER MINES, LTD. QUEENSLAND

In liquidation since end of 1911 and properties sold to Chillagoe Co., Ltd., for £10,000 cash, with £25,000 6% second-mortgage bonds and 175,000 shares of 10s. each credited 9s. paid.

NEW LYMNI, LTD.

CYPRUS

Secretary and offices: A. C. Gibbons, 32 Great St. Helens, London, E. C., Eng. Mine office: Lymni, Cyprus. J. G. Gordon, chairman; J. E. H. Lomas and Sir Henry C. J. Bunbury, Bart., directors; J. W. Ashworth, mine mgr. Organized Oct. 28, 1909, as successor of Lymni Copper Mining Syndicate, Ltd., under laws of Great Britain, capitalization £20,000, shares £1 par, in £10,000 "A" shares and £10,000 "B" shares, fully paid. Balance sheet, Oct. 31, 1912, shows purchase price of property, £11,372; development to date, £5,553; engineer's reports, office expenses, etc., £2,439; cash on hand, £615.

Company owns a 42-year copper mining concession dated Sept. 1, 1910, which covers about 30 sq. miles of mineral land in the Bellathousa district of Polis, Paphos, Cyprus. The lands contain lenses of cupriferous pyrite valued for its sulphur as well as its copper contents.

Development includes the 150' Goat and 300' Fasoti shafts and a 2,100' tunnel. This work developed reserves estimated by W. Y. Westervelt, Nov., 1910, at 3,000,000 tons carrying 1% copper and 50% sulphur and 400,000 tons assaying 2% copper. Some of the ore is, however, high grade and if mined separately could be shipped at a profit.

Concentration experiments 1912, by Claude Vautin, show a satisfactory recovery and a Minerals Separation Co. plant is now under consideration.

NEW QUEENSLAND COPPER CO., LTD.

QUEENSLAND

Secretary and offices: J. G. Tait, 6 Princess St., London, E. C., Eng. Mines and works at Mount Perry, via Bunderberg, Queensland, Aus. G. G. Milne, chairman, and J. Noël Sparks, directors. S. H. Pulbrook, gen. mgr.; J. D. A. Smith, cons. engr. Organized Sept. 27, 1910, under laws of Great Britain as a reconstruction of the Queensland Copper Co., Ltd., capitalization £125,000, shares 10s. par; 125,341 issued and fully paid. Government of Queensland made a £4,000 grant in 1912. Accounts to July 31, 1912, showed copper sales, £6,322; product in transit, £5,132; cash, £188 and a loss of £2,905 for the year's operations, increasing debit balance to £11,313.

Property, 1,650 acres, include the Mount Perry copper mines, the Normanby, New Moonta, Reed's Creek and Great Freehold mines, and other properties in the Burnett district, Queensland. The company also owns the Mount Jacobs mine for fluxing ore, and the Daylesford limestone quarry.

The Mount Perry mine has fissure veins traversing granite, the main vein, of 12' average width, carrying a 6 to 8" paystreak in the upper levels, increasing to about 10" width in the lower levels. This ore averages 16% copper, but the balance of the ground is apparently unpayable, with copper below 16 cts. The vein is opened by 3 shafts, the vertical Milne, or main shaft, being 1,220' deep, and developed underground for a distance of 1,400' along its length. The Kennedy shaft, 1,020' deep, with bottom level at 1,000', is the principal producer of the mine.

The Normanby mine, 240 acres, freehold, bought Feb., 1907, for £12,000, is on the opposite side of the mountain from the Mount Perry, but shows a parallel vein, with ore of a similar nature, averaging 13% copper and 10 to 15 dwts. gold per ton. The 497' main shaft, at the southern end of the property, develops a vein of about 12" width, carrying ore estimated to average 12% copper, 6 oz. silver and 10 dwts. gold per long ton, the 2nd level being opened at 350' with a winze to depth of 450'. There is an ore-dressing plant at the Normanby.

Extensive development was commenced in 1912 in 3 of the mines, the following work being now completed: Straightening the Palmer shaft; sinking the Native Copper shaft an additional 150', the Milne's shaft 120', and connecting the Palmer's and Native Copper shafts on No. 5 level, besides other levels with raises and winzes for ventilation. This development has opened up ore in all the levels. The lode in the bottom of Milne's shaft (1,220') shows no diminution in size or value from the levels above. The bottom levels of both the Palmer's and Native Copper mines are reported to open up shoots of high-grade ore. The output of ore from these mines is increasing each month, and with the development work now being carried on a good tonnage should be obtained for some time to come.

The Reed's Creek mine also has a fissure vein in granite, extensively developed. The New Moonta mine, at Boolboonda, 12 miles N. E. of Mount Perry, is a comparatively new property, having a 450' shaft, which yielded about 2,000 long tons of high-grade ore, 1905. The Great Freehold mine, 811 acres, has a nearly vertical fissure vein, in granite, averaging 5' width, with an 18" paystreak carrying chalcopyrite averaging about 14% copper,

with fair gold and silver values, developed by a 200' main shaft. These mines have been idle several years.

A 50-ton concentrator, at Mount Perry, was put into commission, 1910. The company thus far has been mining only high-grade ores, but it is obvious that future production must be maintained by utilizing the leaner ores, of milling grade, of which considerable quantities have been developed.

The smelter, at Mount Perry, built 1902, is connected with the principal mines at Mount Perry by a train line. This plant does custom smelting and the company has ore buyers at Herberton and Ravenswood. The smelter has 40-ton and 90-ton water-jacket blast furnaces and a reverberatory furnace. There is a 120' smokestack. Smelting operations, suspended during the earlier part of 1912, when production was subordinated to development, were resumed in June and have continued uninterruptedly, treating 4,120 tons of ore returning 421 tons of copper, 19,566 oz. of silver and 260 oz. of gold. The company employs 226 men at the mines and 34 men at their smelting works.

In 1911, running for 6 months, the smelter treated 3,208 tons, containing 1,112,160 lbs. copper, 19,911 oz. silver, and 795.7 oz. gold. The mines have proven disappointing, because the promoters entertained hopes based upon a misunderstanding of the facts, and it is evident that the future of the property must depend largely upon the ability of the company to treat lower grade concentrating ores at a profit. Notwithstanding the results secured so far, the property is considered promising.

NEW RHODESIA DISTRICT DEV. CO., LTD.

RHODESIA

Secretary and offices: A. W. Bird, 2 London Wall Bldgs., London, E. C., Eng. H. L. Stokes, chairman; H. W. Fox and P. B. S. Wrey, directors. Mashonaland Agency, Ltd., managers in Rhodesia. Organized Aug., 1900, capitalization £300,000, shares 299,700, £1 par, and 6,000 founders shares, 1 s. par; 150,000 ordinary and all the founders shares issued, fully paid. Accounts for year 1911 show total expense account to date, £81,497; investments, £75,756, now worth £160,369.

Company was formed to develop mining claims in Rhodesia, S. A., and is a general holding company, owning at present 2,500 Bwana M'Kubwa shares and 12,500 Rhodesia Copper & General Exploration shares, as well as interests in various other companies.

NEW RHODESIA MINES, LTD.

RHODESIA

Secretary and offices: A. J. Hall, Dashwood House, London, E. C., Eng. African agents and offices: Goldfields Rhodesian Development Co., Ltd., Bulawayo, Rhodesia. Marquess of Winchester, chairman; J. Eustace, G. Lewis and A. Zenner, directors. Organized June 3, 1909, capitalization £120,000, shares 2s. 6d. par; issued and fully paid, 948,706. Accounts to May 31, 1912, showed operating loss of £7,752; cash on hand, £7,518; investments, £62,498. Owns shares in the Bwana M'Kubwa Copper Co. and in various African gold and coal properties, also in Porcupine and Alaska mines.

NEW SOUTH WALES MINES & SM. CO.

NEW SOUTH WALES

Address: Breadalbane, N. S. W., Aus. Operating on 170' level in 1912, the vein showing 6' of 8.3% ore, according to reports. Has a smelting plant and plans installation of automatic sampling mill, 1913.

NEW STRATAN COPPERS, LTD.

TRANSVAAL

Office: 4 Trust Bldgs., Fox St., Johannesburg, Transvaal. G. Sonn, chairman; J. M. Calderwood, cons. engr. Organized under laws of Transvaal, capitalization £11,000, shares £1 par, fully issued. Lands include 96 claims on the Limpopo river, also 360 base metal claims on government Farm Stratan No. 1386, in the Zoutpansberg district, latter slightly pros-

pected, showing veins giving average assays of 17.72% copper, with traces of silver and gold.

NEW WEST MUTOOROO COPPER MG. CO. SOUTH AUSTRALIA

Company liquidated. The Mutooroo mine was dismantled by the Government early in 1912, but was unwatered and worked for the sulphur content of its pyritic ore by the De Bavay Co. of Broken Hill, in May, 1912.

B. NEWGASS & CO., LTD.

SPAIN

Idle many years. Office: 75 Lombard, London, E. C., Eng. Mine near Changoa, Navarra, Spain. Lands include the Arrieta mine, at Arrieta, and the Changoa mine, at Changoa, carrying silver-lead and copper ores.

NICHOLSON & SONS, LTD., JOHN.

ENGLAND

Office: Leeds, Eng. Mine office: Hunslet, Yorkshire, Eng. Property includes copper reduction works using the wet process for extracting values from cupriferous cinders remaining from the burning of iron pyrites for making sulphuric acid. The company also manufactures acids and ammonia.

NIJNI-TAGILSK (DEMIDOFF) MINES & WORKS.

RUSSIA

Office: Italianski 3, St. Petersburg, Russia. Mine and works office: Bogoslovsk, Nijni-Tagilsk, Perm, Russia. P. T. Zamiatnin, mgr.; L. Tchelischeft, mgr. of smelter. Is owned by estate of P. P. Demidoff, Prince San Donato. Property includes the Miednorudiansk, or Rudianski mine and various other properties, besides the Vijski, or Wiysk smelting works.

The house of Demidoff was granted, by Peter the Great, 2,150 sq. miles of land, on the eastern slope of the Urals. This property includes various copper mines and smelters, 11 iron mines and furnaces, the largest platinum mine in the world and gold placers that employ about 25,000 men during the summer months.

The Miednorudiansk copper mine is at Bogoslovsk, on the outskirts of Nijni-Tagilsk in the Ural region. The mine was discovered in 1720 and has been worked since 1813, being one of the largest copper producers of all Russia in the middle of the nineteenth century. Country rocks are beds of the Permian series with bunches and large pockets of rich ore, in Permian red beds, and as contact deposits in limestone near diorite. The mine carries a great variety of copper minerals, including oxides, carbonates, silicates, phosphates, sulphides and occasional native copper, but is especially notable for its production of massive malachite, a single mass weighing 330 tons having been found in 1836. Ores average 2½ to 3.5% copper without appreciable gold or silver values. The northern part of the mine has chalcopryrite, associated with magnetite, the central part of the mine carries oxidized copper ores, with gangue of hematite and red clay, and the southern part carries small nodules of oxidized copper ores, and occasional sulphides, with talcose gangue. As would be inferred from this varying character, the ores occur in deposits of different nature, the sulphides being in contact deposits, the oxidized ores as replacement deposits.

Equipment includes 8 steam engines, aggregating 520-h. p. Ore is taken to the smelter over 1½ miles of standard-gauge railway, in side-dumping cars.

The Vijski (Wiysk) works do smelting partly in water-jacket blast furnaces, partly in 6 brick shaft furnaces, of a type in use since the eighteenth century, and partly in 2 patented reverberatory furnaces. The works have coal and coke pockets, and flux is mainly limestone, used very sparingly, with all charging done by barrow and shovel. The ore carries up to 10% moisture. Coal comes from the Luneffski mine, belonging to the Demidoff estate, about 100 miles N. E. of Nijni-Tagilsk, by rail, but this cokes poorly and coke from Donetz, in southern Russia, costing \$11.50 per metric ton, is used.

Pyritic ores are roasted, both in heaps and in rectangular shaft kilns, with waste wood, 1 cord being required for 10 tons of ore, but owing to ore being roasted in large lumps, there is comparatively slight reduction in sulphur contents.

There are 6 shaft furnaces, of about 20 tons daily capacity each, built of red brick, with bottom made of a mixture of ground quartz and fire clay, tamped into place and enclosed by a sheet-iron cylinder, each furnace being 48x96" in diameter at the tuyeres, and 5' 6" at the top of the boshes, 4' above the tuyeres, and 5' 10" at the charging floor, with height of 7' 4" from tuyeres to the feed floor. Each furnace has 12 tuyeres, and a movable hood connecting through a sliding joint with a stack, there being no dust chamber. Each shaft-furnace has a forehearth, or settling basin 2' in diameter and 2' deep, in front of the slag tap, connected by launder with a secondary basin, about 3' distant, slag flowing continuously from the second basin into wrought-iron slag pots of the type used 20 years ago. Notwithstanding this primitive method of handling slags, the cost is only 5½ cts. per ton. Matte is tapped once in 24 hours, production averaging about 1 ton, and the slag-brick blocks at the slag tap must be replaced after nearly every tapping. The shaft furnaces are charged every 2½ hours, and require cleaning every second day, this necessitating 4 hours of idleness, and producing much material for remelting. Shaft furnaces last 3 to 10 months, and each requires a crew of 6 men per 8-hour shift, a premium being given for excess tonnage smelted.

The reverberatory furnace is 16' 6" x 27' 3", with 12x3' 6" fire-grates, ore being charged at each end of the hearth, and matte tapped from the middle. The essential feature of the furnace is the use of downdraft fire-boxes, with direction of the flame reversed every 2 hours. The reverberatory is fired with wood, requiring 1 cord of wood for 2.92 tons of ore, the wood being best quality pine, with a little birch, fully seasoned.

First fusion matte carries 32 to 35% copper and is heap-roasted 11 successive times, beginning with 20-ton, and ending with 100-ton heaps. The process of roasting takes 90 days, and losses are entailed through leaching by rains.

The roasted matte, having a sulphur tenor of 5 to 6%, is smelted in small brick shaft furnaces, yielding black copper, white metal and slag. The black copper, of 95.38% average copper tenor, is refined in 8' 3" x 9' 6" gas-fired regenerative furnaces, with blast furnished by 5 Root blowers and a vertical 6-cylinder fan, air being sent through galvanized iron tuyeres, equipped with 2 cast-iron nozzles, that are inserted through the ladle door. The power is furnished by 4 steam engines and 1 turbine.

The smelter employed 450 men in 1912, working 3 shifts. Production was 4,917,896 lbs. fine copper in 1902; falling, owing to the flooding of the mine, to 2,962,250 lbs. in 1905; 6,383,357 lbs. in 1907; 3,890,959 lbs. in 1908, and for first 6 months of 1910, was 69,593 lbs. fine copper, or at the rate of about 4,750,000 lbs. for the year.

Production for the past 10 years has averaged 90,285 tons annually, yielding 4,247,000 lbs. fine copper. The total production for the past 99 years, ending in 1912, is 4,940,395 tons, yielding 285,300,600 lbs. copper.

NIKKO COPPER WORKS.

JAPAN

See Furukawa Mining Co.

NIKOLAJAV WORKS.

RUSSIA

Office and works: Nijni Novgorod, Russia. Property is a copper reduction plant, with an electrolytic refinery of 70 tanks, having multiple arrangement of electrodes, with a daily capacity of 1 metric ton of electrolytic copper.

NILPENA COPPER MINING CO., LTD.

SOUTH AUSTRALIA

Mine near Blinman, Taunton Co., South Australia. Company had a subsidy of £290 5s. 3d. from the South Australian government. Lands, near Parachilna gap, about 10 miles from Blinman, show 4 veins of 4 to 10' width, carrying pockets of low-grade malachite, with quartz, calcite and iron gangue. Mine is developed by 2 short tunnels, 1 of 200' being connected with a 130' shaft. No recent returns secured.

N'KANDHLA SYNDICATE, LTD.

NATAL

Idle. 1 Great Winchester St., London, E. C., Eng. Mine near Ungoya, Zululand, Natal. A. Lee, secretary. Organized March 13, 1902, under laws of Great Britain, capitalization £2,000, shares £1 par; issued £1,800. Property was prospecting rights over 4 blocks, each 600 yds. square, on the Umhlatuzi river, N'Kandhla district, Zululand.

NOLANGENI NICKEL & COPPER SYNDICATE, LTD.

CAPE PROVINCE

Idle. Mine office: Mount Ayliff, East Griqualand, Cape Province. Alfred E. Gibson, E. S. Campbell, J. Taylor and Maj. A. Webster, directors; J. P. Johnson, engr. Capitalization £10,000, vendors taking £200 cash and £7,800 in shares. Owns 2 acres, showing surface ores assaying up to 0.97% copper and 2.08% nickel. A short tunnel shows chalcopryrite disseminated in pyrite, assaying 7.6% copper and 4.89% nickel. The property is also said to carry platinum. Was developing, with a small force, at last accounts, 1910. No recent returns secured.

NONOGASTA; SOC. FRANCESCA DE MINAS y FUNDICIÓN DE.

ARGENTINA

Idle. Mine and works office: Nonogasta, Rioja, Argentina. Lands include the Andueza, Atacama, Muerto and San Toribio copper mines, also various silver mines, in the Tigre district. Ores of the Andueza are claimed to average 5 to 20% copper, 3 oz. silver and 2 oz. gold per ton, but veins are very narrow. Equipment includes steam power and a small smelter, built 1887, to treat dry silver ores, but altered to smelt copper.

NORDDEUTSCHE RAFFINERIE.

GERMANY

Office and works: Hamburg, Germany. Property is an electrolytic plant, having 600 tanks, with multiple arrangement of electrodes, yearly capacity being about 3,000 metric tons of cathodes.

NORDISKA GRUFAKTIEBOLAGET.

NORWAY

Main office: Östersund, Sweden. Mine in the Rjöpparfjord mining district of Norway. J. P. Hård, pres.; Erik Johansson, vice-pres., at Östersund, Sweden. J. P. Kirkhus, supt.; W. Carlgren, mg. engr., of Falun, Sweden. Organized Jan. 9, 1902, capitalization 818,400 kroner, shares 300 kr. par, fully paid, nonassessable; issued, 1,850 ordinary and 870 preferred.

Property comprises 112 claims with 6 orebodies now being developed. Ores reported to carry 1¼% copper and management estimates 2,000,000 tons in sight. Examined 1913, by Otto Stallmann, of London, for an English syndicate.

NORSK-AMERIKANISK KOBBERMINE & SMELTER; AKTIESELSKABET.

NORWAY

Is Norsk incorporation of Norwegian-American Copper Mine & Smelter Co.

NORSKE AKTIESELSKAP für ELEKTROKEMISK INDUSTRI.

NORWAY

Address: Grong commune, Gjersviken, Nordre Trondhjem; Amt, Norway. Samuel Eyde, chairman. Claims comprise four farms, including the Grong copper mines, at Gjersviken, near the Swedish frontier, accessible by road from Finnvolde, showing extensive and promising outcrops of pyritic

copper ores in schist. Property diamond drilled in 1911-12 and explored by 125' tunnel showing low-grade disseminated ore in schist.

NORTH AUSTRALIAN EXPLORATION, LTD. QUEENSLAND

Company holds options on the Mt. Lindsay and Mt. Lidster mines in the Springs district, Queensland, Aus., and on the Camoranian and Eagle leases, 9 miles from the Duchess mine. Shipments from the first-named mines in 1912 showed good copper values.

NORTH BALFOUR COPPER MINES, LTD. TASMANIA

Idle. Office: 31 Queen St., Melbourne, Aus. Mine office: Mt. Balfour, Russell Co., Tasmania. P. J. Deely, chairman; Prince Cameron, manager, at last accounts. Organized April 7, 1909, under laws of Victoria, capitalization £4,000, shares £5 par. Lands, 110 acres, adjoining the Mount Balfour mine on the N., near the Frankland river, on the N. W. coast of Tasmania. Property shows a large copper outcrop, supposed to be the extension of the vein of the Mount Balfour mine. Shut down several years and presumably out of business.

NORTH COBAR LIMITED. NEW SOUTH WALES

Secretary and offices: Claude Bott, 26 Victoria St., London, S. W., Eng., and Equitable Bldg., Sydney, N. S. W., Aus. Mine at Cobar, Robinson Co., N. S. W., Aus. A. Parks Smith, pres.; Col. A. G. Pawle and H. Pearce, directors. J. Leah, gen. mgr.; W. H. Trewenack, cons. engr. Company is a reorganization of the Great Cobar North, Ltd. Organized under laws of Great Britain, Feb., 1913, capitalization £350,000, shares 5s. par. Shareholders in old company received 3 new shares, credited 4s. 3d. paid for each £1 share held. Shares issued, 72,924. Financial statement of May 26, 1913, showed receipts £6,249 with payments of £4,532 for liquidation expenses and Australian current expenses. Cash on hand £1,717; £750 more, making total of £1,750, will be paid for preliminary expenses.

Property includes mineral leases Nos. 11, 12, 13, 20, 21, 31 and 48, total 400 acres, adjoining the Great Cobar immediately at the north. Surface shows silicious gossan. Development by 4 shafts, No. 3 the main working shaft, being 1,609' in March, with levels at 500', 700', 1,300' and 1,500'. A quartz vein and a wide mass of crushed slate and quartz with pyrrhotite, magnetite and chalcopryite, appearing to be the northern continuation of the Great Cobar lode, was cut at 1,450'.

The easternmost vein, outcrop passes through the Great Cobar property, while main lode of the Great Cobar runs as an ill-defined, but wide mass of silicious fragments through the North Cobar property, about 40' W. of No. 3 shaft. Study of the Great Cobar lenses has indicated to the government geologist that the N. lens of the Great Cobar will be cut in the North Cobar at 1,700 to 2,000' in depth. Company's engineer cabled in March that the W. crosscut at 1,500' showed 3' of solid ore. Extensive development in previous years has failed to disclose payable ore in commercial quantities, but present management indicates that future work in No. 3 shaft, together with diamond drilling, is likely to prove successful in discovering lenses of commercial ore. Property considered promising.

NORTH COPPER CO., LTD. SWEDEN

Idle. French office: 55 Avenue Bugeaud, Paris, France. Mines in province of Småland, Sweden. O. Carlander, secretary. Organized July 4, 1906, under laws of Great Britain, capitalization £1,000,000, shares £1 par, in half preferred and half deferred ordinary shares.

Lands are independently reported as 12 four-hectare claims, 48 hectares, and are reported by the management as 50 copper and zinc claims, 400 acres, the Karsebo mines, in the parish of Ramqvilla, the Säfsjö mines in

the parish of Norra Ljunga, and 3 iron deposits at Ingmalala, in the parish of Froderyd, all in the province of Småland, Sweden.

NORTH DUCHESS COPPER CO.

QUEENSLAND

Organized in Sydney 1912, capitalization £20,000, shares 10s. par; 8,000 issued. Owns the North Duchess lease, adjoining the Duchess mine, in Cloncurry, Queensland, Aus. Developed by 110' shaft at last accounts, without meeting with good values. Company will crosscut and drift on 200' level.

NORTH LYELL MINE.

TASMANIA

Owned by Mt. Lyell Mining & Railway Co., Ltd.

NORTH MOUNT BALFOUR COPPER MINES, N. L.

TASMANIA

Office: 31 Queen St., Melbourne, Aus. Mine office: Mount Balfour, Russell Co., Tasmania. P. J. Deely, chairman. Property, 4 sections, 110 acres, covering the N. W. extension of Murray's Reward vein, showing quartz veins 1 to 2' wide in altered slate and carrying graphite and hematite. Ledge consists of brecciated slate, cemented by carbonates and quartz. Developed by long tunnel cutting 5 small veins, the best showing 4' of quartz at 431' from portal and reaching the main lode at 540' where it contains some excellent ore.

NORTH MOUNT BOPPY, LTD.

NEW SOUTH WALES

Secretary and offices: W. F. Garland, 5-6 Queen St. Place, London, E. C, Eng. H. W. Snow, chairman; G. Hardie, Major-General P. D. Henderson, directors. John Taylor & Sons, London, cons. engrs. Organized Dec. 12, 1906, and is second reconstruction of the Royal Oak of Hauraki, Ltd.

Property comprises 90 acres, known as North Mt. Boppy, adjoining the Mt. Boppy mine in the Cobar district, N. S. W. Development work 1910, proving disappointing, operations were suspended. A new gold property known as the Blue Spec mine in the Hargraves gold field, about 27 miles from Muggee, N. S. W., was then purchased for £1,000.

NOR'WEST PROSPECTING CO.

WESTERN AUSTRALIA

Holds option on Breen's copper mine at North Pole, Pilbarra district, W. A. Examined by R. H. Crozier, 1913.

NORTH ZAMBESIA CONCESSIONS, LTD.

RHODESIA

Went into voluntary liquidation Dec., 1912. L. Scotland, Friars House, New Broad St., London, E. C., Eng., liquidator.

NORTHERN COPPER (B. S. A.) CO., LTD.

RHODESIA

Address: T. Donald, secretary, 365 Salisbury House, London, E. C., Eng. Operating office: Bulawayo, Rhodesia. Edmund Davis, chairman; Sir Edward H. Dunning, Dr. F. Rutherford Harris and P. Coventry Tarbutt, directors; Bechuanaland Exploration Co., Ltd., mgrs., in South Africa; Percy Tarbutt & Co., engrs.

Organized Feb. 16, 1895, under laws of Great Britain, as Northern Territories (B. S. A.) Exploring Co., Ltd., changing name June, 1899, to present title; capitalization £250,000, increased 1899, from £100,000, shares £1 par; issued £239,608; fully paid. A former convertible bond issue has been retired. First dividend paid Aug. 20, 1910, was 5% cash and 5% in fully paid shares of the B'wana M'Kubwa Copper Mining Co., Ltd.

This company was formed to acquire prospecting and mining rights in various parts of northern Rhodesia. In 1902 a number of the properties were handed over to a subsidiary, the Rhodesia Copper Co., which, in turn, acting in association with the parent company, floated 3 separate organizations, namely, the Rhodesia Broken Hill, the Kafue Copper, and the Bwana M'Kubwa Copper. The Rhodesia Copper also has a financial interest in the Rhodesia-Katanga Railway & Mineral Co., which is con-

trolled by the Tanganyika Concessions and it owns the Kansanshi copper mine. The report of Northern Copper for the year ended May 31, 1913, shows that 363,000 shares in the above-named companies are held, valued at £116,120. The liquid resources consist of cash and loans against security, £25,868, and debtors, including the Kafue Copper Co., £40,232, a total of £66,000, compared with £78,000 the year previous. The company still owns a number of mineral concessions that are awaiting development, and these are valued at £38,042. Operations for the year 1912-13 show a small loss.

Owing to interchanging of share interests between this corporation and various subsidiary and collateral companies, and the custom of giving reports on mining properties, in which share interests are owned, it is difficult to arrive at the true status of this company, or its exact holdings. The descriptions of the Silver King, North Star, Maurice Gifford, Crystal Jacket, True Blue, Blue Jacket and Sable Antelope mines, formerly given under this title, are given in this volume, under the name of the Kafue Copper Development Co., Ltd., the real owner.

Jan. 1, 1913, property consisted of 3 blocks of 10 sq. miles each, carrying both surface and mineral rights; mineral rights over 10 sq. miles, at Chanobi; 2 tracts of 10 sq. miles each, at the N'Kala and Lunga Sulphur springs; the Lukali farm of 13,500 acres, on the Lukali river; the Algoa farm of 500 acres, between the Lusenswa and Lukashashi rivers; a 10% undivided interest in certain holdings of the Rhodesia Copper Co., Ltd., and 280 mining claims, 377 alluvial claims, and a further right to peg out 205 more claims in northern Rhodesia. Prospecting operations are in progress.

The Chanobi mine, 45 miles from the Silver King, has 5 shafts, on 4 separate outcrops. No. 1 shaft is 100'; No. 2 outcrop has a N. shaft of 92' and a S. shaft of 98', latter showing favorable copper values at bottom; No. 3 outcrop has a 78' shaft showing chalcopyrite and occasional chalcocite; No. 4 outcrop shows copper carbonates on surface. Apparently the various outcrops are of the same small sulphide vein. Improvements at the Chanobi include a warehouse, and a compound for native workmen. Transportation is by traction engines to the railway, at the Kafue river, which will probably run in time to the mines. The company's fortunes are closely linked with those of the M'Kubwa and Copper Mining and Kafue Copper Development companies and it is doing pioneer work in opening up the copper deposits of Central Africa.

NORTHERN MINING & SMELTING CO. NORTHERN TERRITORY

Mine at Leigh's Creek, Northern Territory, Aus. Organized 1903. Company received a subsidy at £350 from the South Australian government. Owns the Mount Rose mine, about 2 miles N. of Mount Rose, and 30 miles from a railway.

The Mount Rose mine, developed by 4 shafts, deepest 203', shows gossan in 2 or 3 short pipes with steep dip. These pipes contain pockets of rich carbonates and gray copper ore up to 35% copper, succeeded in depth by chalcocite and chalcopyrite with pyrite in a gangue of micaceous shale.

To Feb., 1906, the property had produced 370,720 lbs. fine copper. During the last half of 1907, the output was 50 long tons of ore yielding 39,984 lbs. copper. Only prospecting work being done in 1912-13.

NORTHERN TERRITORY OPTIONS, LTD. NO. TERRITORY

Address: Pine Creek, Northern Territory, Australia. Company has option on Coronet Hill mine, 35 miles from Pine creek, the railway terminus. Property includes 320 acres, showing favorable outcrops carry-

ing copper and gold values. Development shows a 40 to 60' lode on which a 100' shaft has exposed 34' of vein matter carrying gold and copper on bottom level, with lead-silver ores above. Field is a new one of apparent merit, which is now being energetically prospected.

NORWEGIAN-AMERICAN COPPER MG. & SM. CO. NORWAY

Office: Chicago, Ill. Operating office: 3 Fjordgaden, Trondhjem, Norway. Mine offices: Levanger, Trondhjem, Norway, and Goulasjok, Lyngenfjord, Tromsø, Norway. Adolph Larson, president. Organized April 20, 1905, under laws of South Dakota, capitalization \$1,000,000, shares \$1 par, non-assessable. Annual meeting, first Monday in April.

Lands, 54 claims, in 5 groups, distributed in 4 districts, formation being much the same, at the various properties. Country rock is micaceous schists, of lower Silurian age, with eruptive greenstone conformable with the schists, orebodies occurring as thin lenses, very persistent in strike and depth, on the contact of the schists with metamorphosed olivine gabbro. Ore is cupriferous pyrite, carrying 3 to 10% copper and 10 to 30% sulphur, with small gold and silver values.

The Fines mine, the principal property, is about 1 mile S. of the head of the Værranfjord, a branch of Trondhjemsfjord, about 60 miles from Trondhjem. All property is owned outright, except the Fines and Tingstad mines, which are held under a contract, by which they can be bought for \$42,500 cash, or the same price in yearly installments, or can be operated for 90 years on a royalty basis. The Fines, an old mine, operated in a small way, many years ago, has an ore channel carrying lenses of 3 to 10' width, with an average of about 6', one lens being proven for about 1,200' in length. Development includes several thousand feet of shafts, tunnels, crosscuts and drifts, and about 10,000 tons of ore have been extracted. The ore carries 0.15 to 5% copper, and about 45% sulphur, and Dr. J. H. L. Vogt, the eminent geologist, of Christiania, estimates that the concentrating ore will average about 1.6% copper.

The 80-ton mill has 1 crusher, 2 Chilean mills, and two 80-ton Elmore vacuum oil flotation units, of which only 1 is installed, the other being on the ground. The company reports an extraction of 85% of the assay values, producing concentrates averaging 11.8% copper from ore averaging 1.6% in copper tenor. The mill has a 100-h. p. Tangye suction gas producer, burning anthracite coal. A 3,000' aerial tram leads to shipping bins upon a wharf at tidewater.

The Tingstad mine is in a valley near the Fines, and is held under the same contract as the Fines, on the basis, alone, of a cash price of \$10,000, or a royalty of 35 cts. per metric ton on production.

The Skardahl mines include the Bratfjeld and Skarfjeld mines, at the head of Kaafjord, a branch of the Lyngenfjord, lands being extensive, extending for 10 miles up both sides of the valley. This property apparently is of more promise than the Fines and Tingstad mines. The Skardahl group shows 3 veins, 1 apparently an extension of the orebody of the Birtavara mine, and 2 parallel veins, about 16' apart, are developed by 3 tunnels, of about 3,000' aggregate length. The upper vein ranges up to 3 meters in width, and the lower up to 2 meters, and there is a possibility that these veins will join at depth. Development work gave about 1,000 tons of ore, of which 200 tons assayed 6.7%, 400 tons assayed 4%, and 600 tons assayed 2.2% copper, an average of 4.3%. Prof. Vogt classes ore of 5% or better as smelting ore, and ore under that tenor as concentrating ore. The Skardahl group has produced 4,500 tons of ore, shipped to smelters, under this company's ownership. This group also includes the Kobber Liens mine, 2 miles up the valley from the Bratfjeld.

Improvements at the Skardahl group include an office, accommodations for 50 workmen, and several other mine buildings. There is a 2,300' aerial tram, and a small river near by has a 300' waterfall, which should give several hundred horsepower. The Lyngenfjord does not freeze over in winter.

Miscellaneous holdings include claims on the Island of Vandö, near Tromsö, and the company also holds mining lands in the Signaldahl, of the Lyngenfjord. The Os or Faadals mine, formerly owned by King Christian Frederick of Denmark, is near the Meraker mines, in the Røros district of Trondhjem. The various properties include water rights to a number of valuable waterfalls.

Radical disagreement between the directors and Mr. Boholm, the Norwegian manager, led to the suspension of work in 1910.

NORWEGIAN COPPER & GENERAL MINING CO., LTD. NORWAY

Secretary and offices: H. J. Anning, 21 Bucklersbury, London, E. C., Eng. S. Miall, E. P. Bainbridge and S. H. Menzies, directors. Organized March, 1912, under laws of Great Britain, capitalization £64,000, shares £1 par; all issued and fully paid. Company took over various options on mining properties in Norway and Sweden from the Evenoes Mining Syndicate, Ltd.

NOVAJA-ZEMLJA MINING CO.

RUSSIA

Company formed in 1912 to investigate copper deposits near Popes bay on Nova Zembla island. An expedition was fitted out at a cost of 200,000 rubles, financed by some Russian banks, with the S. S. Nikolai II and a full corps of assayers, engineers and workmen. Expedition returned Nov., 1912, and the reports being favorable, the property will be opened up on a commercial scale some time in the future. The scientific results will be brought out by the Russian geological survey.

NOVIKOFF & CO.

TURKESTAN

Address: Naukat via Kokand, Russian Turkestan. Succeeds Compagnie Anonyme Nasaroff, a Belgian corporation. Owns the Supetau copper mines and a small ore dressing, concentration and smelting plant on right bank of the Syr Daria river, between the villages Hodja-Yogana and Tchil-Mashram. The Supetau mine shows steeply inclined beds of copper-bearing sandstone, interbedded with limestone. The metallic copper occurs in flakes, grains and nuggets cemented by calcite and gypsum. The ore-beds aggregate 18 to 20' in thickness and are traceable for 12 miles up and down the river.

Property, 2 claims, 83 hectares, developed by several shafts of 10 to 35', deepest being 70'. There are 5 nearly vertical copper-bearing beds varying from 2 to 7' thick and averaging 1.75 to 2.25% copper, excluding coarse nuggets. At the mill, the beds come together and the ore is 20' thick, averaging 2.25% in the open cut and 2.5% copper at 64' depth. The combined 5 beds are 8.4 meters thick and opened for 1,600' horizontally.

NUESTRA SONORA DE LA SALUD; SOC. MIN.

SPAIN

Idle. Mine at Chaparrita, por Rio Tinto, Huelva, Spain. Property, 110 hectares, including 11 old mine workings. A small production of cement copper was secured by leaching waste left from former operations.

NUEVA AUSTRALIA MINE.

PERU

Mine near Pacasmayo, Cajamarca, Peru. Has a lens of low-grade disseminated pyritic ore, of considerable size, opened by tunnel. The smelter has calcining and reverberatory furnaces, burning wood. Product is shipped, as bars, to Cajamarca.

NUEVO PORVENIR SMELTER.

CHILE

Owned by Sociedad Minera San Juan, at Higuera, Coquimbo, Chile.

NYMAGEE COPPER, LTD.

NEW SOUTH WALES

Dissolved Aug. 29, 1911, and was succeeded by the Nymagee Copper Co., Ltd.

NYMAGEE COPPER CO., LTD.

NEW SOUTH WALES

Address: Nymagee, Mouramba, N. S. W., Aus. M. Ansen, mgr.; Mr. Lyon, cons. engr.; Mr. Martin, supt. Company organized 1912, to succeed Nymagee Copper, Ltd. Owns Nymagee mine, one of the oldest and largest copper producers of the state, situated 50 miles S. E. of Cobar. Property produced 341,191 tons of ore, yielding 22,021 long tons of copper up to the year 1908.

Property has a large acreage and shows according to the N. S. W. Geol. Survey, an outcrop of slate and sandstone with inconspicuous copper staining. The lode is 30' wide throughout the mine, and carries lenticular orebodies, the main ore shoot being 15 to 20' thick, 250' long and averaging 10% copper. The Nymagee Copper, Ltd., purchased the property 1906, dismantled the old plant, put in a new equipment 1907, and went broke 1910. The 700' level of the mine, the lowest worked by the old company, showed a lens 15' wide, 200' long, averaging 3% copper. The present company reopened the mine 1912, and proposes to spend £40,000 in developing new orebodies.

The Nymagee smelter, rebuilt 1907, has 3 small water-jacket blast furnaces and 4 small reverberatory furnaces for refining matte to blister copper of about 99.5% copper tenor. Largest production of the Nymagee was 2,388,320 lbs. fine copper, 1886. Production was 1,630,720 lbs. fine copper in 1898, and was 26,649 long tons of ore smelted, averaging 2.5% copper, yielding 1,491,840 lbs. fine copper in 1906. Although the average grade of Nymagee ore is dangerously low, the property is considered of promise, if given the railway transportation facilities absolutely essential to its successful operation.

OBYE MINE.

JAPAN

Sakamoto & Co., owner, Nakanosha, Okayama, Bitchu, Japan. Employs 850 men. K. Ogawa, manager. Is a very old mine having numerous 2 to 4' veins carrying chalcopryite and small quantities of argentiferous galena with quartz gangue, traversing clay-slate and granite. Equipment includes a 1,542-h. p. steam and 110-kw. electric installation. There is a good smelter in connection with the mine. Production was 1,455,488 lbs. copper in 1906, 1,202,878 in 1911 and 759,831 lbs. in 1912.

OCAÑA; CAMILO.

CHILE

Idle. Address: Taltal, Antofagasta, Chile. Owns the Estrella de Venus mine, opened to depth of 125 meters; ore, hand sorted, carries an average of 24.1% copper. Also owns the Ligua and Gyacolda mines with gold and silver-bearing copper ores. Equipment includes steam power and there is a concentrator with 4 Chilean mills.

OGOYA MINE.

JAPAN

Mine office: Nishio-mura, Nomi-gori, Kaga, Japan. Takatoshi Yokohama, owner and general manager.

The mine, the sixth largest producer of Japan, opened 1878, carries chalcopryite, with bornite and pyrite, in numerous quartz veins traversing rhyolite. Three parallel main veins are worked, ranging 1" to 4' in width and 500 to 2,000' in length. The mining plant is modern and there is a hydro-electric power installation. Smelter, formerly of 30 tons daily capacity, has been enlarged. Production was 1,503,967 lbs. fine copper in 1906, 2,476,153 lbs. in 1911 and 3,079,951 lbs. in 1912.

O. K. COPPER CO., N. L.

QUEENSLAND

In liquidation. Sidney Cornish, 23 Brookman's Bldg., Adelaide, S. A.,

liquidator. Mine and works office: Chillagoe, Lynd Co., Queensland, Aus. Organized June 23, 1909, under laws of Queensland, as a reconstruction of the O. K. Copper Mines Development Syndicate, N. L., capitalization £70,000, shares 4s. par; issued 337,450 shares. The old company paid total dividends of £92,798, and had protracted litigation with A. Hirsch & Sohn, of Halberstadt, Germany, resulting in an adverse verdict for £19,570 and costs, compromised by a cash payment of £16,500, and all the money that the company had, necessitating a reconstruction.

Property, 4 mineral leases, 90 acres and a 60-acre smelter site at O. K., near Mungana, North Queensland, includes the O. K. mine. Land shows altered silicious argillaceous and hornblendic shales, carrying irregular lenses of ore, capped by a practically barren gossan. The two orebodies developed range from 12 to 80' in width, and carry oxidized ores to 40' depth, succeeded by about 120' of high-grade chalcocite and passing out of the shaft at 170'.

Exploration by 2,000' of diamond drilling, failed to disclose better than 5% ore, considered by management to be too low in value to be profitably mined.

The main shaft, of 300' depth, has levels at 80', 115', 150' and 200', levels being much too close together. Very little development work was done, 1906-07, during the era of high prices, though after the break, sinking and development was resumed, but too late. The 300' level has developed unsatisfactorily and the rich ores have been pretty thoroughly gutted, but considerable bodies of low-grade smelting ore remain.

The smelter has a calciner and a 36x72" blast furnace, of 70 tons capacity, with a brick dust-chamber and stack. The converter department has 1 stand with 4-ton Leghorn shells.

Production was 13,867 long tons of ore smelted, with an average recovery of 10.8% copper, yielding 2,341,197 lbs. fine copper in 1906; 3,351,197 lbs. fine copper in 1907; 3,404,800 lbs. in 1908, and 1,500,000 lbs. in 1909. The smelter was blown out Oct., 1909, blown in again Jan., 1910, and all work was finally suspended June 9, 1910. In the last month of smelting, April, 1910, the works treated 1,122 long tons of ore yielding 61 tons of blister copper carrying 961 oz. silver and 49 oz. gold, showing a recovery of but a little better than 100 lbs. of copper per ton smelted. The mine is considered valuable, although it lacks transportation facilities.

OKER: VERWALTUNG d.KGL. PREUSS. & HERZOGLICHEN

BRAUNSCHWEIGISCHE KOMMUN HÜTTEN-

STAATSWERKE.

GERMANY

Is smelting plant of Rammelsberg mine, Goslar, Hanover, Germany.

O'OKIEP MINE.

CAPE PROVINCE

See Cape Copper Co., Ltd.

D'OREY; WALDEMAR.

PORTUGAL

Office: 4 Praca dos Remolares, Lisbon, Portugal. Mine at Castro Verde, Alemtejo, Portugal. José P. d'Orey, general manager. Organized 1907, under laws of Portugal, capitalization \$20,000, shares \$100 par, payable at call.

Owens the Algaré mine, with 2 claims, 100 hectares. Property shows schist of lower carboniferous age, with large beds of quartzite carrying several orebodies. 1 under development of 15 meters estimated width, traceable 400 meters, having an iron gossan carrying copper oxides and carbonates. Development by 2 shafts and a tunnel, with about 300 meters of workings, showing about 500 tons of ore, giving assays up to 45% copper.

ORIENTE DE THARSIS MINE.

SPAIN

Office and mine: Alosno, Huelva, Spain. Wm. Guthrie Bowie, man-

ager. Property includes the Oriente de Tharsis mine, 16 hectares, owned by Wm. Guthrie Bowie & Sons and the Mina Hueca, 12 hectares, owned by Sr. D. Eduardo Diaz. The property covers the downward extension of the Hueca pyrite deposit. The land adjoins the holdings of the Tharsis mine on the E., and lies along Kilometers Nos. 2 and 3 of the Tharsis railway, which passes through the tract.

The mines have old Roman shafts, whose deepest workings are 90 meters. The property has an irregular gossan, but the lenticular orebodies of the Hueca mine dip into the Oriente de Tharsis ground. The modern shafts of the Hueca have just reached the pyritic zone. The mine has 3 levels opened, workings amounting to 400 meters, showing several orebodies; 1 of 12 meters width, carrying ore assaying up to 5% copper; 1 of 7 meters width, assaying up to 4% copper, and a third, of 5 meters width, assaying up to 3.5% copper. The second level shows a mammoth orebody of 135 meters width, carrying ore averaging about 1.25% copper. Property considered promising.

ORITO; COMPANIA DE MINAS EL.

CHILE

Office: Valparaiso, Chile. Mine office: El Orito, Vallenar, Atacama, Chile. Organized July 19, 1904, under laws of Chile, as a reorganization of Sociedad Minera el Orito, capitalization £50,000, shares £5 par. Property includes Las Breas mines, opened 1888, which formerly produced about 1,000,000 lbs. fine copper yearly.

The smelter, known as the Fundición El Orito, or Fundición Las Breas, 18 leagues from Vallenar, has 2 reverberatory furnaces turning out matte of about 60% average copper tenor. Fuel is both coal and wood. Production was 847,009 lbs. fine copper in 1907 and 698,564 lbs. in 1908, but the smelter has been idle since 1909.

ORKLA MINE CO. (GRUBE-AKTIEBOLAG).

NORWAY

Office and mine: Lökken Vaerk, Meldalen, Søndre Trondhjem, Norway. Dr. F. Esser, gen. mgr.; F. Brocha, sec. Organized Dec. 7, 1904, under laws of Norway, capitalization 4,140,000 kroner, shares 180 kroner par, increased later to 7,000,000 kroner. The company formerly was controlled by the Orkla Mining Co., Ltd., now dead.

Lands, 232 claims, 2,500 hectares in the Meldal and Orkedal valleys of Søndre Trondhjem. Principal properties are the Lökken, Höidal and Dragset mines, carrying 2 main ore belts, the southern running from the Dragset through the Lökken and Höidal mines to the Aamot mine, in the S. E. a distance of about 9 miles. The northern zone runs from the Holum mine to various ore deposits on the Grefstadfjeld in the E., a distance of about 6 miles. Ore occurs as disseminated chalcopyrite and cupriferous pyrite in veins and lenses, in a brecciated schistose diorite of Silurian age. The ore deposit is estimated by the management to average 2 to 3% copper and 40 to 45% sulphur, with 5,000,000 metric tons of ore in sight.

The Lökken mine, opened A. D. 1657, has a 200' upper shaft and 750' incline shaft, having a double hoist for ore, and a double hoist for men, and there is a 900' tunnel. This mine shows large orebodies. The Höidal group, opened A. D. 1680, includes the Gamla Höidal and Nya Höidal mines, principal openings being tunnels of 200' and 500'. The Dragset mine has shafts of 200' and 300', and a 100' tunnel.

The Aamot and Kong Karl mines have 100' tunnels each, and the Victoria mine, opened 1870, is also slightly developed. The Holum mine, a new property, has 3 parallel orebodies, of 3 to 5' width, traced for distance of about 160'.

The concentrator, at the Lökken mine, has 11 Elmore vacuum oil flotation units, and is rated at 800 tons daily capacity, being the largest copper

concentration mill in Scandinavia. Ore is brought to the mill by an 8.4-kilometer aerial tram from the Dragset mine, and a 2.7-kilometer aerial tram from the Höidal mine. The principal mining machinery is at the Lökken, near the mill, and includes two 20-h. p. Ingersoll-Rand air compressors.

The mine and works use 1,200 h. p. electric energy, brought 30 kilometers from the Skjaenaldfos hydro-electric installation, at 15,000 volts, in a 3-phase alternating current.

The company has its own postoffice and telegraph office, by permission of the Norwegian government.

The Chr. Saldeson & Chr. Tham's Communication Aktieselskab is a subsidiary corporation, organized by this company for power and transportation purposes, which has developed the water power at Skjaenaldfos, and built a 28-kilometer electric railway, equipped with 8 electric locomotives and 60 cars, running from the Lökken mine to Thamshavn, at the mouth of the Orkla river, in the Orkedalsfjord, where the company owns large wharves for goods and passenger traffic and has automatic loading devices for the dispatch of ore. This company also owns a steamer that makes 2 round trips daily, between Thamshaven and Trondhjem.

Production began 1910, when the output was 38,000 metric tons of pyritic lump ore, and 12,000 tons of concentrates, estimated to have yielded 2,000,000 lbs. fine copper. The property is considered decidedly promising and the present company seems capable of carrying out the work planned and becoming a profitable concern.

ORTONA MINE.

QUEENSLAND

John Moffat, owner, Percyville, Queensland, Aus. Property is a new mine on the Percy river, 12 miles from Percyville and 42 miles from the railway at Forsyth, in the Chillagoe district. Mine has developed a deposit of commercial ore and is equipped with a concentrator. A government railway line is planned.

OSORIO i CA; ENRIQUE.

CHILE

Idle. Mine office: Mina Grande, La Serena, Coquimbo, Chile. Property, the Misterio mine, which produced, at last accounts, about 300 metric tons of 22% ore annually from a vein of about 40" average width, opened to 50 meters depth. Also La Purisima mine, which produced about 400 tons of 18% ore, equal to an output of 300,000 lbs. fine copper for both properties.

OTA MINE.

JAPAN

Mine office: Ota, Yamaguchi, Nagato, Japan. Kunizo Ikuta & Co., owners. Equipment includes a 468-h. p. installation and forces averaged 239 persons in 1911. Production was 73,145 lbs. fine copper in 1906; 1,028,869 in 1911, dropping to 52,344 lbs. copper in 1912.

OTAVI EXPLORING SYNDICATE, LTD.

GERMAN S. W. AFRICA

Secretary and offices: C. Launspach, 1 London Wall, London, E. C., Eng. Mine office: Grootfontein, German S. W. A. E. Davis, J. B. Schroeder, H. Strakosch, directors. Organized Dec. 15, 1909, under laws of Great Britain, capitalization £63,000, shares in £60,000 ordinary shares of £1 par and 60,000 deferred shares of 1s. par.

Company is a prospecting syndicate organized for the purpose of exploring and developing the 1,000-sq. mile tract of the Otavi Mines & Railway Co. The lease excludes properties already located, runs until 1919 and calls for a rental of 35% of the net profits of operation. Company mined 354 tons of copper-lead ore in 1913.

OTAVI MINES & RAILWAY CO. (OTAVI MINEN

UND EISENBAHN GESELLSCHAFT). GERMAN S. W. AFRICA

G. Launspach, London secretary, 1 London Wall Bldgs., London E. C., Eng. Main office: 31 Unter den Linden, Berlin, Germany. Mine office:

Tsumeb, Otavi, German S. W. A. Management committee: Gustav Duft, M. von der Porter, J. Kloke. Directors: Dr. P. Dr. Fischer, Dr. P. Schwabach, Komm. Rat M. Steinthal, E. Davis, P. Boettger, E. Zintgraf, F. Urbig, J. Thometzek, mine mgr.; Baurat A. Morgenstern, railway mgr.

Organized April 6, 1900, under laws of Germany, capitalization 4,000,000 marks, originally 1,000,000 marks raised to 20,000,000 in 1903 and reduced to present figure, 1910; shares 20 marks par, in 20 series of 10,000 shares each, fully issued. There are also 200,000 deferred shares of no assigned value. Is controlled, through ownership of about 55% of the stock issue, by South West Africa, Ltd. Annual meeting in December.

This company was formed by the South West Africa Co., Ltd., the Direktion der Disconto Ges., of Berlin and the Exploration Co., Ltd., to deal with the development of mineral and railway rights in the concession owned by the South West Africa Co., Ltd., including a copper-lead property. A railroad 350 miles long, built by the company, connecting the company's property with the seaport of Swakopmund, was finished 1906, and sold 1910, to the German Government for \$5,500,000. Company then leased the line for 10 years, with 20 year further option, at 5% (and for renewal) 15% of purchase price.

The company's plan of finance calls for carrying a 5 to 15% reserve, followed by dividends of 5% on ordinary shares, after which 10% is allowed the board as a bonus, out of surplus, the board taking, however, but 7½%. Balance is divided equally between the ordinary and deferred shares. Profits for fiscal years ending March 31 were 350,145 marks, practically all from the railway, in 1907; 4,339,057 marks, of which 2,443,620 marks came from the railway, and 1,824,696 from mining operations, in 1909; 3,629,364 marks in 1910, with net profits of 1,687,168 marks from the railway, and 2,071,942 marks from the mine; 4,490,928 marks net profit in 1911; 3,370,310 marks net profit for year ending March 31, 1913. Dividends were 11% on ordinary and 6 marks on deferred shares in the fiscal year 1909; 10% on ordinary and 5 marks on deferred shares in the fiscal year 1910; 8.5 marks per ordinary and 6.5 marks per deferred share in 1911; 6 marks per ordinary and 5 marks per deferred share in 1912; 8 marks on ordinary and 7 marks on deferred shares paid Aug., 1913.

Owms mining rights to 1,000 sq. miles, and 500 acres of freehold land in the Otavi district of German S. W. Africa, also 814 sq. miles, in strips of 10 kilometers width, along the right-of-way of the railway, the property including valuable farming lands, the farm Usakos having produced considerable revenue. The Tsumeb mine is the chief producer, but the property also includes the Otavi, Guehab and Asis, or Klein Otavi mines. The different mining properties carry copper and lead carbonates and sulphides, in dolomitic limestone, with good values in both lead and copper, and the ore, being complex, is mainly sent overseas for reduction.

The ore deposits are neither regular nor of large extent, but are profitable on account of their richness. The deposits along the railway line Otavi-Grootfontein have been entirely worked out and those near Asis, nearly so. The branch railway line to Arandis, built for the Khan mine, is completed, and that property is now a producer.

The Otavi Valley mines, include the Asis, Guchab and Groot Otavi mine, all now practically worked out. The latter opened to a depth of 300', has yielded large amounts of high-grade ore. The Guchab mine, at Kilometer 54 of the Otavi-Grootfontein railway, supplied rich silver-copper ore, 1,800 metric tons shipped 1908, averaging 33% copper and 0.04% silver. These mines all show eruptive rocks similar to that which has been found to be the ore bringer at Tsumeb and recent development work under a specially-

trained engineer is under way, in the hope of discovering new orebodies. Production was but 1,900 tons in 1912-13.

The Tsumeb mine, the largest and most productive mine owned, was discovered 1892, by natives, and taken over 1901, by this company. The Tsumeb shows a large orebody that is a replacement deposit in limestone, adjacent to a mineralized, igneous rock. The main orebody is of 310 meters proven length, with maximum of 23 and average of 9 to 10 meters width, so far as developed. The vein has a dip of 60 to 70°, carrying 2 exceptionally rich ore shoots, with a lean section between, the rich shoots both being wider than the lean part and showing a tendency to enlarge with depth. The mine has a strong gossan standing above the surface for some distance. Ores are copper oxides and carbonates, with some lead carbonate, succeeded at slight depth by argentiferous chalcopyrite and galena, with occasional chalcocite, having a calcareous and arenaceous gangue.

Development originally was by shafts, changed shortly to opencast workings, but again changed 1908, to mainly underground development. The mine has 4 shafts, opened 1892-93, and 2 shafts sunk later. The Main shaft is 434', Old West shaft 160', New West shaft 225', Old East shaft 66', and another shaft of 180' depth. Levels are opened at depths of 65', 160', 225', 328' and 426'. The New West shaft has a 70-meter drift disclosing ore of even better average grade than is opened above. The orebody is opened for a horizontal distance of 310 meters, having 34 crosscuts, of 440 meters aggregate length, and a 20-meter winze, giving a total of about 4,000' of workings, estimated to show 313,000 metric tons of high-grade ore averaging 16% copper and 25% lead. In addition to the high-grade ore, there is an undetermined amount of what is termed low-grade ore, lying between the 2nd and 3rd levels, in an irregular lens, assaying 7 to 8% copper and 5 to 6% lead, with lime and sandstone gangue.

Development for 1912-13 comprised 32 meters of shaft sinking, 55 meters crosscut on the 5th level, with 47 meters drifting E. and 32 meters W., showing the orebody to be as large and even richer than above and opening up 100,000, tons of new ore that carries copper glance and galena. A drift 130 m. long on the 4th level developed a streak 0.6 to 4 meters thick of pay ore; the main 4th drift continued 67 m. struck a body of chalcocite, 18 meters long and 1 to 3 wide. The eruptive rock is 15.6 meters thick and all mineralized. The continuance of the extremely rich ore of the Tsumeb to the greatest depth opened offers great encouragement, ore values gaining rather than decreasing to the present depth of 434'.

The Tsumeb West mine is being developed and a deposit of mottranite was discovered 1912, from which 200 tons of copper and lead-bearing vanadium ore was shipped containing an average of 10% vanadic oxide. Company secured an option 1912, on the Otjivarongo copper deposit.

Equipment includes a new central electric power plant driven by a Diesel engine and a new duplex hoist good for 1,000' with an old 180-h. p. steam plant and 100-h. p. electric plant, with two 60-h. p. hoists, good for depth of 400' each. Fuel is coal and wood.

A pumping station at Otjikotosee, 20 kilometers from the Tsumeb, sends water through a high-pressure line to a large reservoir at the mine. A 50-ton concentration plant has been ordered to treat the low-grade ore of the eruptive rock.

The smelter, at the Tsumeb mine, of 50 tons rated daily capacity, has 2 small blast furnaces. Iron ore for fluxing is obtained from Kalfeld, near Kilometer 308 of the railway. Fuel is charcoal and coke, latter costing 90 marks per metric ton delivered, an almost prohibitive price. The smelter ran 112 day for the fiscal year ending March 31, 1913, the high value of the

Tsumeb ore and high price of copper making its exportation more profitable than local smelting. The smelter produced 655 tons of matte carrying 48% copper, 25% lead and 420 grams silver per ton. The lead bullion produced amounted to 400 tons of 98% lead and 910 grams silver per ton.

Production for 1910-11 was: 31,600 tons of ore shipped carrying 16% copper, 24% lead and 290 grammes silver; smelters produced 2,220 tons 45% copper matte and 2,040 tons lead bullion. During 1911-12, 29,600 tons was shipped carrying 16% copper, 25% lead and 270 grammes silver per ton, and smelters produced 91 tons copper matte and 913 tons lead. In 1912-13, 44,550 tons was shipped carrying 13% copper, 25% lead and 230 grammes silver, the lower metal content being due to 8,000 tons of old dump ore shipped. Production for April-Sept., 1913: 25,560 tons ore against 21,600 tons for same period, 1912; 507 tons copper matte against 255 tons, 1912; 45 tons lead against 215 tons, 1912.

Company has a splendid management, both financial and technical, and the Tsumeb mine has given really marvelous returns for the limited development work and has now better ore in sight than at any previous time.

OTTER COPPER CO., LTD.

SCOTLAND

Office: 105 St. Vincent St., Glasgow, Scotland. J. Kenneth, H. H. Scott, J. S. Taylor and I. G. Findlay, directors. Organized in Edinburgh, March, 1912, capitalization £18,000, shares £1 par. Company is developing copper mines in Argyllshire, Scotland.

OTTO LÜCKE FABR.-UND MINERALWERK.

GERMANY

Mine office: Hadamar, Hessen-Nassau, Germany. Organized 1879. Lands, 300 acres, in the Westerwald, including the Oscar, Niederzeuzheim, Schiller, Göthe, Joseph III, Adolph II, Hellersberg, Rollsborg, Jacob, Christian, Dorchheim, Bruch, Schiefer, Frühling, Eiskeller, Josephine and Waldmannshausen mines, carrying ores of copper, iron manganese and sulphur.

OUASTA ET DE MESLOULA; COMPAGNIE DES

MINES D'.

ALGERIA

Office: 60 Rue de la Victorie, Paris, France. Mine near Meskiana, Ain-Beida, Constantine, Algeria. G. Mirabaud, president. Organized Jan. 6, 1903, under laws of France, capitalization 1,500,000 francs. Mine yields a complex sulphide ore carrying zinc and copper.

OUED-MOUGRAS COPPER & IRON CO., LTD.

ALGERIA

Idle. Office: 135 Wellington St., Glasgow, Scotland. Mine office: 5 Rue Lemercier, Bône, Constantine, Algeria. T. T. Stewart, chairman; John Alston, T. Hunter, C. S. Mair and D. Bruce Allan, directors; J. A. French, sec. Organized Oct. 9, 1903, under laws of Great Britain, as a reconstruction of a company of the same name, capitalization £12,500, increased, July 12, 1907, to £30,000, shares £1 par; issued, £24,243.

Property, a partly developed iron-copper mine, acquired from Chas. S. Mair of Tigh-na-Mara, Bona, Algeria. No recent reports received.

OUENZA; SOCIÉTÉ CONCESSIONAIRE DES MINES D'.

ALGERIA

Office: 24 Rue Mogador, Paris, France. Mine office: Morsott, Constantine, Algeria. MM. Cardozo, Taraud, Kroller, Pascal, Richard, Portalis, Muller, Vêrane and Vicomte Saint-Jouan, directors. Organized June 18, 1903, under laws of France, capitalization 2,500,000 francs, shares 500 francs par.

Property is the Djebel Ouenza mine, on the Tébessa railway, 25 kilometers from Clairfontaine, near the Tunisian frontier. The property shows an immense gossan of cupriferous hematite, carrying granules and flakes of argentiferous malachite ore which with selection carries 2 to 8% copper. The gossan is hematite, of high grade, valuable for iron, regardless of its copper contents, but presumably at depth will be succeeded by basic copper

ores, or more likely by the sulphide complex of copper, lead and zinc, typical of most Algerian copper deposits.

A leaching plant built on the bank of the Melleéque river, about 4 kilometers from the mine was not a success, owing to poor transportation facilities and rather poor practice. It was proposed to build a railway to the mines and work them for iron ore, also to remodel the leaching plant in another effort to extract the copper values. Mine considered promising both for iron and copper.

OUTOKUMPU COPPER MINE.

FINLAND

Address: Outokumpu, Kuusjarvi, Finland. According to the British Consul at Helsingfors, this property, opened in 1912, has 80,000 tons of ore in sight, valued at £238,100, or \$1,157,166, and zinc worth £37,800, besides having probable ore valued at £3,000,000 and possible ore at £8,000,000, which is interesting if true, as it would class it as the world's largest single copper deposit.

OVERFLOW MINES, N. L.

NEW SOUTH WALES

Idle. Office: 18 Bridge St., Sydney, N. S. W., Aus. Mine near Bobadah, N. S. W., Aus. T. H. Palmer, manager, at last accounts. Ores carry gold, silver, lead and copper, latter being produced merely as a byproduct. Has a Ball mill, 40-ton cyanide plant and 50-ton smelter.

OVOCA COPPER SYNDICATE.

IRELAND

Secretary and office: W. Smith, 10 Austin Friars, London, E. C., Eng. Mine office: Ovoca, County Wicklow, Ireland. Maj. Ralph P. Cobbold, chairman; Capt. F. B. Lawson and L. F. Hirschler, directors. Organized Nov. 27, 1901, under laws of Great Britain, capitalization £12,000, shares £1 par; fully issued and paid. Accounts for year ending 1911, showed £1,040 loss.

Property, the old Cronnebane mines, in the Vale of Ovoca, which were making about 1,250,000 lbs. refined copper yearly, at the end of the eighteenth century. Mines were closed 1875, and reopened 1902, on the advice of Mr. Philip Argall. High-grade oxidized ores were mined out in past operations, but the vein, about 50' in average width, shows immense bodies of low-grade disseminated chalcopyrite with quartz gangue, estimated to average 3% copper, 1.5% zinc, 1.5 oz. silver and 1 dwt. 6 grains gold per long ton. A new shaft was sunk, and 838 tons of concentrate shipped in 1909-10 that realized £600. Property considered promising. No recent returns secured.

PAIPOTE SMELTER (FUNDICION DE PAIPOTE).

CHILE

Owned by Yelaya Hermanos at Paipote, Atacama, Chile.

PAISLEY MINE.

QUEENSLAND

Mine address: Muldiva, Lynd Co., Queensland. Property is a copper-silver-lead prospect, slightly developed by opencuts and a long tunnel. Is a small shipper and under development, Aug., 1913.

PALQUI; COMPAÑIA MINERA EL.

CHILE

Mine office: El Palqui, La Ligua, Aconcagua, Chile. Mine, 12 miles from Cabildo, has a mantos, or blanket vein, of about 17' thickness, showing an abundance of ore of 5 to 6% average copper tenor, but is handicapped by transportation charges averaging 6.65 pesos per metric ton to the Cabildo smelter. Idle.

PANULCILLO & CONDENSA COPPER MINES & SMELTING WORKS.

CHILE

Is owned by the Central Chile Copper Co., which see.

PARAMATTA & YELTA MINES.

SOUTH AUSTRALIA

Mine office: Wallaroo, Daly Co., So. Aus. South Australian Government, owner. Frank Richards, manager. Lands, 1,350 acres, including the Para-

matta, Yelta, Wheal Hughes and Wheal James mines, which together with the smelter were purchased by the State government for £6,000 in 1911.

Property shows felsite porphyry, carrying 3 known veins, dipping from 60 to 70° and averaging about 3' in width. Ores are mainly chalcopyrite, with a little bornite, and a gangue of quartz and silicious feldspathic material. The Yelta ores also carry a high percentage of iron.

The Paramatta mine is an old producer, adjoins the Moonta, and has a main shaft 816' deep, equipped with modern machinery.

The Yelta, the principal mine, is situated about 1 mile N. of the Moonta, and presumably carries the extensions of the several veins worked in that famous property. There are 3 veins, the main vein opened by a 1,200' shaft, unwatered to 1,080' in 1912, showing the vein to have an average width of about 6', with ore of about 5% copper tenor. Property was extensively diamond drilled 1912, and 968' of prospecting work and ore development was done in the year ending June 30, 1912.

The smelter, at Yelta, is connected with the Paramatta by a tramway, and has a 60-ton blast furnace, making 30 to 40% matte. The concentrator, built of stone, has a Blake crusher, rolls, and 5 Wilfley tables.

Equipment at the mines includes 4 hoists, good for depth of 2,000', and 3 air compressors, with capacity for 25 drills.

Production for 6 months ending June 30, 1912, was 2,244 tons of 5% ore, with half as much more broken, but held under ground.

PAULL'S CONSOLIDATED MINE.

NORTHERN TERRITORY

Office: Leigh's Creek, N. T., Aus. Property, formerly known as the Friend mine, on Burr creek, 1½ miles N. of Burr well, in the Mount Lyndhurst district, has a vein of 4 to 10' width, carrying copper carbonates and gray ore, and is said to also carry vanadium ore at shallow depth. Development is by numerous pits and shafts, of 15 to 100' depth, and a 300' incline shaft, with levels at 90', 150', 200' and 250', having about one-half mile of workings, in ore reported to show some chalcocite. The vein carries rich seams and stringers of 1 to 4" width, with low-grade ore between. Equipment includes a small mill, but ore is dressed by hand and a limited production was being secured, 1912.

PEÑA COPPER MINES, LTD.

SPAIN

Secretary's address: R. L. Rodger, 736 Salisbury House, London, E. C., Eng. Mine office: Nerva, Huelva, Spain. C. C. D'Anvers, chairman; Dr. N. Brückner, deputy chairman; M. Paisant, Nicol Brown, H. Schmitz, A. Harter and C. A. Massaouti, directors; Enrique Schreck, mine mgr. Organized Sept. 19, 1900, under laws of Great Britain, and capitalization increased, Jan., 1905, to £600,000, again increased Nov., 1911, to £750,000, shares £1 par; issued £537,600. Debentures, originally £200,000 authorized and £193,800 issued, at 5%, have been reduced to £8,900. Net profits for fiscal years were £17,293 in 1905; £45,697 in 1906; £19,522 in 1907; £29,792 in 1909; £21,944 in 1910; £24,199 in 1911, and £25,752 in 1912. £12,000 in bonds were retired 1912, leaving a balance of £13,752, as compared with £24,199 the year previous. Dividends were 5% in 1903; 5% in 1904; 4% in 1905, and 7½% in 1906, since when no dividends have been paid, the company wisely reserving its profits to meet future financial requirements.

Lands, about 1,721 acres, 2 miles N. E. of the Río Tinto mine, known as the Peña del Hierro group, consisting of 17 old mines, taken over from the Sociedad Peninsular de Brussels. Extraction is mainly opencast and large quantities of overburden are removed, stripping having amounted to 195,430 cu. meters in 1905; 220,869 cu. meters in 1906; 174,324 cu. meters in 1907; 185,435 cu. meters in 1909; 1,104,437 cu. meters in 1910; 89,034 cu. meters in 1911 and 67,367 cu. meters in 1912.

The mine output for 1912 was 84,698 tons, compared with 131,367 tons in 1911, the decrease being due to inability to get railway cars for 3 months of the year.

Eventually the capping is to be removed almost completely, and the mine worked opencast, down to the 9th level. There is a limited amount of underground work in progress, the mine being opened to the 12th level. Ore reserves were estimated, Dec., 1912, at about 3,974,461, compared with 3,850,000 long tons in 1911.

Equipment includes a new central power plant, a crushing plant, shops and a number of dwellings. A $2\frac{1}{2}$ -mile private railway, equipped with 1 locomotive and 14 cars, connects the mines and works with the nearest public line, and a new railway 22 kilometers in length, connecting the mines with the port of Seville, was nearly completed, 1913.

Ores produced are divided into cupriferous pyrite, pyrite and washed sulphur ore, latter being ore previously leached for copper and sold for sulphur contents.

The cupriferous pyrites of the Sierra Morena lend themselves with special facility to copper extraction by a combination of natural weathering and artificial leaching, and this process, in use by the Peña, gives cheap costs, but entails heavy investments and long waits before profits are returned, a term of 4 to 5 years being required for the complete extraction of copper values. Occasional dry seasons cause a scarcity of water, restricting production, as in 1907, and again in 1909.

Production was 1,397,760 lbs. fine copper in 1902; 2,199,680 lbs. in 1904; 1,724,800 lbs. copper and 110,000 long tons of leached ore, sold for sulphur, in 1905; 2,421,440 lbs. copper in 1906; 2,036,160 lbs. in 1907; 2,636,480 lbs. in 1908; 2,358,720 lbs. in 1909; 2,278,080 lbs. in 1910; 2,248,960 lbs. in 1911, and 1,776,520 lbs., produced as cement copper, in 1912. Shipments have been as follows:

	Cupreous ore.	Washed ore.	Non-Cupreous ore.	Total shipments.
1898-1910.....	146,350	837,921	235,984	1,220,255
1911.....	16,751	49,334	58,238	124,323
1912.....	20,201	25,425	35,218	80,844

Property considered valuable and management good.

PENRALLT COPPER MINE.

WALES

This old mine in North Wales was reported sold to an English syndicate, 1913, which proposed opening the old workings. Like numerous other projects to reopen old mines, this must be regarded as a doubtful enterprise.

PEÑUELAS; SOCIEDAD ANONIMA MINAS DE.

SPAIN

Office and mine: Paimogo, Huelva, Spain. José Maria Soto y Rosso, chairman; Miguel Borreo Morón, vice-chairman; Mateo Santos Mora, sec.; Gregorio Peres Diaz, treas. Organized July 19, 1898, under laws of Spain, capitalization 12,600 shares, all issued.

Land, 500 hectares, in the Paimogo district, showing slate and granite, with numerous fissure and contact veins, 1 under development is of 4' estimated average width and has oxidized ores, succeeded at slight depth by chalcopyrite said to give average assays of 15.34% copper. The mine is developed by shafts of 200', 30', 60' and 50', and by tunnels of 150' and 130'. The deepest shaft is bottomed in slate carrying a slight impregnation of cupriferous pyrite, and it is obvious that the lens of ore is shallow.

Equipment includes an 18-h. p. hoist and there are 17 dwellings for workmen. The mine is served by Tharsis railway. Idle since 1907.

PERCY RIVER SYNDICATE.

QUEENSLAND

Office: Irvinebank, Queensland, Aus. Mine office: Ortona, Gilbert Co.,

Queensland, Aus. G. C. Young, sec.; John Moffat and A. Linedale, owners; Jas. Puxley, gen. mgr.

Lands, 5 leases, 130 acres, known as the Ortona mine, and an 80-acre smelter site lying along the southern bank of the Percy river, about 5 miles above its junction with the Gilbert river. Property carries 11 fissure veins in diorite with E.-W. strike and dip of 55 to 87°. Eight veins, under development, estimated to average 2' wide, carry malachite, cuprite and chalcocopyrite ore, averaging 15% copper, 10 oz. silver, and from a trace to 5 dwts. gold per long ton. Development is by the 225' No. 1 shaft on vein No. 1; 165' No. 2 shaft on vein No. 2; 55' No. 3 shaft on vein No. 3; 70' No. 5 shaft vein No. 5; 176' No. 6 shaft on vein No. 6; 25' No. 7 shaft on vein No. 7; 130' No. 8 shaft, on what is known as No. 2 West Lode. The workings are mainly on No. 2 vein, where there is a 12-h. p. hoist. The company also has 3 veins on the Caledonia group, 10 miles south of Ortona.

PEREZ; FRANCISCO DE PAULA.

CHILE

Mine office: Los Condes, Santiago, Chile. Works office: Ñuñoa, Santiago, Chile. Property includes La Central mine, opened 1880, adjoining the property of the Compañía Esplotadora Los Bronces, developed by a tunnel driven jointly. Company also owns the Mina Disputada and the San Agustín mine, developed by tunnel. Ores average, after selection for smelting, about 23% copper.

The smelter, known as the Fundición La Central, has a matting furnace only.

PERU MINES & ESTATES, LTD.

PERU

Secretary and office: W. J. Chivers, 39 Lombard St., London, E. C., Eng. Mine office: Huaraz, Ancachs, Peru. W. Blount, A. Gandolfi and H. R. Willats, directors. Organized April 8, 1909, under laws of Great Britain, capitalization £150,000, shares £1 par; fully issued and fully paid. The company owns sundry oil, gold, silver and a 1,360-acre copper mine, in the Huaylas valley, Ancachs, Peru, formerly held by Hudsons Cons., Ltd.

PERUVIAN DEVELOPMENT SYNDICATE, LTD.

ENGLAND

Liquidated voluntarily, 1911.

PERUVIAN MINING, SMELTING & REFINING CO.

PERU

Office: 400-55 Congress St., Boston, Mass. Mine office: Morococha, Junín, Peru. Mine office: Río Blanco, Huarochirí, Lima, Peru. Julio L. East, general manager. Organized July 16, 1906, under laws of Maine, capitalization \$5,000,000, shares \$5 par; issued \$4,000,000. Bonds, \$950,000 outstanding, at 7%, convertible. Is controlled, through \$1,000,000 stock ownership, by the United States Smelting, Refining & Mining Co.

The Churruca mine, in the Sierra de la Santa Cruz, near Morococha, at an elevation of 15,500' above sea level, was bought 1907, of the Compañía Minera Churruca. The mine has a large lens of massive chalcocopyrite, with gangue of brecciated country rock of metamorphic calcite. Ore is said to average 9% copper, with considerable gold and silver contents, but probably this figure is for selected ore. The mine is opened by the Grau and Roland East tunnels.

The smelter, fully described Vol. X, was sold 1912, to E. E. Marshall, Lima, Peru, and the company's property reported foreclosed under a mortgage, 1913.

PHILLIPS RIVER GOLD & COPPER CO., LTD.

W. AUSTRALIA

In liquidation March, 1913, L. W. Hawkins, liquidator, Basildon House, Moorgate St., London, E. C., Eng. Fully described Vol. X.

PHENIX MINES (CORNWALL), LTD.

ENGLAND

Secretary's address: H. M. Willis, 24 Walbrook, London, E. C., Eng. Mine office: Liskeard, Cornwall, Eng. J. H. Gretton, chairman, and D.

Richards, C. C. Baker, R. J. Hoffman, J. Barry, C. Wanklyn, H. J. Moir, directors. Organized June, 1909, capitalization £116,000, increased, 1912, to £210,000; shares £1 par; fully issued, there being 50,000 preferred and 160,000 common shares.

Company has a 31-year lease, dating from March 25, 1907, on 700 acres of copper and tin-bearing land, about 7 miles N. of Liskeard, the terms of the lease calling for the payment of a royalty of one-thirtieth of all tin and copper produced. The royalty is payable to the Duchy of Cornwall for a period of 15 years dating from March, 1912.

The mine was extensively worked during the last century. A new working shaft, planned to intersect the lode at about 1,020', was being sunk 1912, and a reduction plant of 400 tons daily capacity is to be erected.

PHENIX MINING CO.

CHILE

Office: Valparaiso, Chile. Mine office: Tocopilla, Antofagasta, Chile. Organized April 18, 1905, under laws of Chile, capitalization 250,000 pesos, shares 100 pesos par. Jas. L. Bennett, manager, at last accounts.

Property, 15 acres of mineral land, 3 miles from Tocopilla, and 7 acres at the port of Tocopilla, former including the Santa Rosa mine, developed by a 320' tunnel; the San Pedro mine, having a 20-h. p. hoist; La Teresa mine, having a 25-h. p. Fairbanks-Morse hoist and a Blake crusher, and La Colorada mine, these properties carrying a little oxidized copper ore, but mainly chalcopryite.

Equipment includes 2 Babcock & Wilcox boilers, burning petroleum, and a small Ingersoll-Rand air compressor. La Colorada mine is connected by ground tram with the Anglo-Chilian Nitrate & Railway Co.

PILOU MINE.

NEW CALEDONIA

Mine office: Ouegoa, Arama, New Caledonia. Lands, in the vicinity of the Ao and Balade mines, in the northern part of the island, have a main vein with principal ore shoot at the intersection of a cross vein, proven to a depth of 240 meters, though with greatly diminished copper values at depth. Ore carries chalcopryite, with some galena, the richest ore returning 10 to 12% copper and 600 to 650 grams silver per metric ton. The mine has considerable ore of 6 to 4% copper tenor and was estimated 1889, to have 40,000 metric tons of low-grade ore in sight. The property was owned formerly by the Caledonia Copper Co., Ltd., and Les Mines de Cuivre Pilou, Ltd.

Equipment includes an old 250-ton concentrator, formerly making concentrates of 12 to 18% copper tenor. Presumably idle.

PISHMINSKO-KLUCHEVSKI WORKS.

RUSSIA

Office: Quai Tutschkof 18, St. Petersburg, Russia. Mine and works office: Verkh Issetzki, Ekaterinburg, Perm, Russia. Is owned and operated by Count Stenbok-Fermor's Estate. Property shows several veins in gabbro-diorite, principal orebody being a vein of chalcopryite averaging about 10% copper. The mine has 6 shafts, with 8 small steam engines and employs about 1,000 men. Production was 868,188 lbs. fine copper in 1905; 1,099,104 lbs. in 1907; 1,726,984 lbs. in 1908; 2,210,523 lbs. in 1909; 3,105,718 lbs. in 1911, and 3,900,204 lbs. in 1912.

PITKÄRANTA KOPPARBRUK.

FINLAND

Owned by Ladoga Lake Mining & Smelting Co., Ltd., at Pitkäranta, Viborg, Finland. Fully described Vol. VIII.

PLAKALNITZA MEDNA PLANINA.

BULGARIA

Office: care of Fils A. Mavrokordato, owners, Constantinople, Turkey. Mine office: Plakalnitza, Vratza, Bulgaria. Lands, 5 miles from Elisena, on the Sofia-Vratza line, are held under a concession from the Bulgarian crown. Property shows bornite, tetraedrite, malachite and chalcopryite ores in

lenticular-shaped masses in dolomite. The ore-bodies range from 3 to 10' in thickness, and are said to average 5 to 7% copper. Mine is opened by a 220' shaft. Equipment includes a small concentrating plant and a 7-mile aerial tram, connecting the mine with a smelter.

PLURDALEN COPPER MINE.

NORWAY

Is owned by the Raven Copper Co., Ltd., which see.

PODEROSA DE CHUQUICAMATA; COMPAÑÍA MINERA. CHILE

Mine office: Chuquicamata, Calama, Antofagasta, Chile. Enrique Vilegas Encalada, gen. engr.; Manuel A. Rojas A., supt. Organized 1908.

Lands, on the Chilian desert, with difficult transport and hard conditions of living, include the Poderosa and Pánizo mines, former opened to depth of 150 meters and latter to depth of 130 meters. The mines show considerable brochantite and atacamite, also chalcopyrite and cupriferous pyrite, and have developed a good amount of concentrating ore. The Pánizo mine has a Blake crusher.

The mill, known as the Huamachuco works, built at a cost of 40,000 pesos, is at Huamachuco, in the vicinity of Calama, and employs 12 men. Equipment includes cylindrical trommels giving 5 products, passing rings of 25, 19, 12, 6 and 3 mm., fines constituting the greater part of the concentrates. There are 2 Ferrari tables, and a No. 4 Ball mill, run dry, yielding 4 to 8 metric tons daily of 2-mm. concentrates. Mill losses average about one-third of assay values, it being difficult to save the brochantite and atacamite when milled in combination with sulphide ores, owing to the light weight of the chloride and sulphate ores.

A hydro-electric plant, near the mill, transmits current 500 meters, and there is an auxiliary steam plant having a Babcock & Wilcox boiler and condenser.

Production is about 400 metric tons of ore from the Poderosa mine, and 275 metric tons of ore from the Pánizo mine, monthly, averaging 12.5% copper. The mill treats an average of 16 metric tons daily of ore assaying 5 to 6% copper and produces about 100 metric tons monthly of 17% concentrates, shipped partly to England and partly to the Tacoma smelter. Forces were 160 men, 1913. Property probably absorbed by Chile Copper Co., the new Guggenheim flotation, 1912.

PODEROSA MINING CO., LTD.

CHILE

Secretary and office: F. W. Bishop, 145 Dashwood House, New Broad St., London, E. C., Eng. Operating office: Casilla 855, Antofagasta, Chile. Mine office: Collahuasi, Tarapacá, Chile. Chas. Fearn, chairman; L. W. Harris, V. Echeverría and W. J. Barnett, cons. engr., directors; W. Watson and C. Crempien, mgrs. Organized Nov. 27, 1908, under laws of Great Britain, capitalization £500,000, shares £5 par; fully issued and fully paid. Paid a 5% dividend, amounting to £25,000, July 15, 1909. The property was taken over March 17, 1909, from the Compañía Minera Poderosa de Collahuasi, this company having been organized to bring the property under the laws of Great Britain, in order to make an English market for the shares, the former owner being paid £480,000 in stock, or 96,000 full paid shares, for its property. The old company earned a profit of £84,923 in 6 months ending June 30, 1908, and paid dividends of £60,000.

Lands, 37 contiguous claims, 185 hectares, or 457 acres, including the Poderosa, which is the principal producer, and the San Carlos, Rosario, Conдор and other mines. The lands lie at an extreme elevation of 15,400', among the rounded peaks on the western edge of the Bolivian plateau, a region above the timber line, and barren of vegetation, with the exception of yareta, which constitutes the fuel of the district. Copper mines were worked in this district during the era of Spanish dominion, and previously by the

Indians, as evidenced by remains of ancient furnaces, fragments of matte, scoria and tools left in old workings. Developments of the mines was begun 1903, and regular ore shipments were begun Jan., 1906.

The property shows the Poderosa, or main vein, a fissure without visible outcrop, lying alongside a diorite dike intrusive in dacite. The vein lies under the dike, but in places departs from it. It has numerous branches and parallel fissures. A fault with a horizontal shift of 50 to 100', lessening downward, separates the vein in 3 portions, worked in the Poderosa and San Carlos mines, respectively. The ore occurs in shoots and is quite rich, carrying 8 to 60% copper and 6 to 8 oz. silver.

The Poderosa mine has 510', 430' and 235' shafts, with a total of about 20,000' of workings, showing oxidized ores down to and including the 400' level. The workings develop 2 veins, known as the Poderosa and Portillo, of 3 to 30' width, carrying high-grade paystreaks of 1 to 20' width, with an average of 30", proven for length of 2,600' and depth of 500', yielding ore averaging about 18% copper and 8 oz. silver per long ton. The hanging wall is well defined, but the ore shades gradually into the altered country rock on the footwall, where there is an occasional gouge, and there is a fluccan of 3 to 12", and even up to 4' in width, on the hanging. The gangue being a decomposed dacite, is very soft, requiring heavy timbering. Levels are opened at 22-meter intervals and connected by winzes. The main shaft was only 6x8' inside of timbers, at last accounts. The mine is moderately wet, making about 90,000 gals. of water per day in the wet season, and is equipped with Gould's, Cameron and Riedler pumps. Rock is broken by 20 Murphy drills. Ore reserves of the Poderosa mine were estimated. Dec 1912, at 15,760 tons of 21% copper ore. About 2½ to 3 tons of material are broken underground to secure 1 ton of shipping ore.

The dressing plant at the Poderosa includes 9x18" and 6x20" crushers, breaking ore to 2 to 3" size, and there is a 75-cm. Robbins conveying belt, used for hand-picking, by which the ore is brought up to an average tenor of about 22% copper, for shipment.

The Rosario mine, N. W. of the Poderosa, has a 166' incline shaft, on a 30" vein dipping at about 80°, developing ore assaying about 15% copper, shaft being bottomed in the top of the base zone, which shows chalcopyrite, arsenopyrite and pyrite.

The San Carlos mine, practically an extension of the Poderosa, and to be connected therewith, has a 146' shaft, showing a 3' vein carrying ore averaging 19% copper.

The Venus mine has a 2' vein carrying ore giving average assays of about 18% copper.

The new power plant has a 14x52-metre building, equipped with 3 multi-tubular boilers, working under 150-lbs. steam pressure, two 100-kw. generators for supplying power to the shops and lighting the mine, and a 5-drill Riedler air compressor. There are 3 steam hoists, 1 a 100-h. p. Fraser & Chalmers engine, and 1 a 100-h. p. 10x15" Tangye double-cylinder hoist raising half-ton buckets with a seven-eighths-inch steel cable. Fuel is mainly yareta, costing only £1 per ton, with a calorific value about 50% that of coal briquettes, which cost £4 10s. per ton, delivered, and hence are but little used. The company also has a Sullivan diamond drill.

Buildings include machine and carpenter shops, a smithy, office, and adobe dwellings for native workmen. The management is considering building a concentrator, and the matter of building a smelter was considered 1909, but decided adversely, as the cost of fuel and all operating expenses would be extremely high at the mine, and the ores have an excess of silica, while readily available fluxes are lacking.

Property was explored, 1911, by diamond drilling, 16 holes being sunk, aggregating 2,444', deepest 301'. This work cost \$9.05 per foot.

Labor is supplied mainly by Bolivian Indians, from the neighboring republic, who work intermittently, putting in about half time. The labor supply has been improved by the advent of the railway.

Costs for 1911 were £129,740, including £5,756 charged off for depreciation and £11,272 for development work. The net loss on the year's operations was £16,995. The average cost per long ton of dressed ore, f. o. b. Poderosa, was £6.2, and the cost of mining and marketing per ton of copper was about £56.

Production in recent years has been as follows: 1909, 10,595,200 lbs. copper; 1910, 10,902,080 lbs.; 1911, 6,419,392 lbs.; 1912, 5,077,204 lbs.

POLARSTERN; GEWERKSCHAFT.

GERMANY

Office and mine: Wallau, Biedenkopf, Wiesbaden, Prussia, Germany. Jacob Donges and Jacob Velte, owners. Organized Jan. 4, 1900, under laws of Prussia, capitalization 20,000 marks.

Lands, 218 hectares, showing an orebody of about 3 meters average width, with E.-W. strike, traceable 4,000 meters, proven to depth of 20 meters, by 10 pits, carrying malachite, chalcopryite and galena, associated with pyrite, estimated to average 13% copper and 13% lead, with gold values undetermined, and with good sulphur values. There is no equipment. Property is for sale for 60,000 marks.

POLIEFF-SYSSERT SMELTER.

RUSSIA

At Nijni-Tagilsk, Perm, Russia.

PORSA KOBBERBRUGER; AKTIESELSKABET.

NORWAY

Mine office: Porsa, Altenfjord, Finmarken, Tromsø, Norway. Ingolf Bjornstad, manager. The Porsa mine was under development, with promising indications, at last accounts. Property also includes the Vesterdalens mines, at Naeverfjord, Finmarken, Tromsø.

PORT KEMBLA SMELTER.

NEW SOUTH WALES

Owned by Electrolytic Smelting & Refining Co., Ltd., Port Kembla, N. S. W., Aus.

PORT LINCOLN COPPER CO., LTD.

SOUTH AUSTRALIA

Secretary and office: R. G. Orr, 731 Salisbury House, London Wall, London, E. C., Eng. Mine office: Reedy Creek, Robe Co., South Aus. J. H. Smith, chairman; A. D. Hunter and H. Sturton, directors. C. Lowe, mine mgr.; Laurence Pitblado, cons. engr. Organized July 13, 1906, under laws of Great Britain, capitalization £350,000 shares, £1 par; fully issued, £250,000 fully paid, and £95,000 paid 15s. Last assessment was 2s. 6d., Feb. 22, 1909. Statement of June 30, 1912, gave cash £1,347, calls in arrears £8,612, creditors £3,832.

Owens the Kitticoola mine, on Tumby bay, N. of Port Lincoln, about 35 miles N. E. of Adelaide. The mine, opened 1845, under the name of Tung-killo, was idle from 1852 until 1890, when taken up by the Reedy Creek Gold Mining Syndicate, and has been known at various times also as the New Reedy Creek, Great Wheel Orford and Kitticoola mine. This property, worked originally for copper, and subsequently for both copper and gold, is the second oldest copper mine in South Australia.

The mine has an orebody, split at surface into the North and South lodes, ranging up to 11' in width, carrying melaconite, bornite and chalcopryite ore that is rich but bunchy, assaying about 18% copper and 4 dwts. 6 grains gold per ton, presumably after selection. The mine has a 420' incline main shaft, with levels at 180', 240', 300', 330', 360' and 420'.

Equipment included three 60-h. p. boilers, 2 hoists, a 20-drill Taylor-Horsefield air compressor, and a 6-drill Rand air compressor, at last report.

Buildings include an office, machine shop, smithy, carpenter shop, warehouse, laboratory and changing house.

The reduction plant includes a 10-stamp mill, having a crusher, Wilfley table, Warren vanner and a Mays double jig. There is a small smelter, having a calciner, reverberatory furnace, and a 45-h. p. engine. The mine is let on tribute.

PORVENIR SMELTER.

In liquidation. Geo. McKenzie and Harry Cohen, liquidators, Johannesburg, S. Af. Described Vol. X.

PROAÑO; LIZANDRO A.

PERU

Office, mine and works: San Mateo, Pacococha, Huarochirí, Lima, Peru. Lands, 512 hectares, with 64 small mines, including 1 flux mine. Property includes 37 mines, with 176 pertenencias, 352 hectares, in the province of Huarochirí, department of Lima, and also 27 mines, 130 hectares, in the province of Yauli, department of Junín. Properties include the Germania, Siberia, Peru, Zambita, La Purísima, Siete de Octubre, Belgica and Cuarto, in the vicinity of Pacococha; Huáscar and the Peru de Viso, at Viso; 26 de Agosto and Chaupichaca, at Aruri, all in the province of Huarochirí, all carrying chalcopryite, more or less argentiferous.

The Germania, Siberia and Peru mines, with combined area of 74 hectares, are worked jointly, employing an average force of 120 men.

The Germania mine, opened 1887, but worked superficially until quite recently, is at Pumagrande, Huarochirí, 17 kilometers from the smelter. The mine workings developed a 5' fissure vein in decomposed hornblende andesite carrying a paystreak of chalcopryite and galena with accessory sphalerite and pyrite, in a quartz gangue, averaging 8% copper, 7% lead and 4% zinc with good silver values and a little gold. Development is by tunnel. The Germania is estimated to have developed nearly 1,000,000 tons of probable and possible ore, carrying 80,000 metric tons of copper, 2,895,000 marcos of silver and 50,000 oz. gold. The mine is capable of a production of about 200 metric tons of ore daily. The physical composition of the ore does not permit wet concentration. The Germania has an old smelter of about 20 tons daily capacity, not in present use.

The Siberia mine has a vein of about 5' average minimum width, parallel with the veins of the Germania and Peru, opened by No. 1 tunnel of 85 meters, No. 2 of 60 meters, No. 3 of 40 meters, and No. 4 of 35 meters.

The Mina Peru has a vein paralleling those of the Germania and Siberia, carrying about 8% copper and up to 25% lead, with about the same silver values as in the Germania. The Peru has been estimated to have in sight about 500,000 metric tons of ore, estimated to carry 40,000 metric tons of copper, 125,000 metric tons of lead, 1,447,528 marcos silver and 25,000 oz. gold.

The Purísima and Purísima Segunda mines, in the vicinity of the Germania, Siberia and Peru, have veins of about 5' width, carrying silver-copper and lead ores in the Purísima Segunda, and silver-lead ore in the Purísima.

The Mina Huáscar, in the vicinity of Tamboraque, has copper and lead sulphides, latter sparingly, carrying good gold and silver values.

The Mina Victoria, 64 kilometers from the smelter at Tamboraque, with rail connection, carries chalcopryite and sphalerite, with small quantities of galena, all strongly argentiferous, estimated to average about 10.75%

copper, 0.45% lead and 24% zinc. The mine is estimated to show about 200,000 metric tons of mixed ores, and has necessary mine buildings.

The Mina Peru de Viso, showing extensive ancient workings, has a vein of about 6" width, carrying ore said to average 7 to 8% copper and 217 oz. silver per metric ton.

The 26 de Agosto and Chaupichaca mines, are adjoining properties, in the vicinity of Aruri, not far from the smelter, developed by tunnel, yielding mainly silver-lead ores.

Equipment includes a Pelton wheel at the Germania group, operating a 60-h. p. dynamo actuating 10 Ingersoll electro-pneumatic drills, and furnishing light for the mine. There are dwellings for about 150 workmen.

Transportation is partly by rail, but is mainly by llamas, which bring in ore from the mines at Pumagrande and Pacococha; about 2,000 llamas being used for transport.

The smelter, known as the Fundición de Tamboraque, is in the pueblo of San Mateo, near the Rio Blanco smelter of the Peruvian Mining, Smelting & Refining Co., at an elevation of 9,826' above sea level, 120 kilometers from Callao, on the Ferrocarril Central del Peru. The works occupy a site of 34,393 sq. meters, or nearly 9 acres, allowing ample room for extension. The plant, formerly of about 40 tons daily capacity, was rebuilt 1908, to the present capacity of 200 metric tons daily. Equipment includes a 50-ton crusher, 50-ton Humboldt rolls, a No. 8 Krupp ball mill, of 1 metric ton hourly capacity, and a Humboldt cylindrical perforated classifier. The works include kilns for calcining, and a 60-ton Brown calcining furnace, connected with a 10x180' subterranean dust flue, burning petroleum, which reduces the sulphur contents of the ore, originally averaging 26%, to about 6%, and 4 McDougal calciners were installed 1910.

The smelter has 3 water-jacket blast furnaces, made in Peru, a 30-ton circular furnace being used for casting, a 50-ton furnace for smelting copper ores, and a 120-ton furnace for smelting lead ores. Copper product is matte, carrying 30 to 40% copper and 250 to 300 oz. silver per metric ton, exported via Callao. The works include a briquetting press, and fuel is German coke and crude petroleum from Talara. Limestone for flux is secured from Carray, 11 kilometers distant by rail.

The 200-h. p. smelter power plant consists of 3 Pelton wheels, taking water by a 3,000' canal, from the Rio Rimac, which furnishes a steady supply during the entire year, and is capable of developing 500 h. p., Sr. Proaño having a concession for 1,900 liters. It is planned increasing the installation by 150 h. p. There are Nos. 5 and 6 Connorsville blowers for smelter blast.

Buildings at the works include a good laboratory and a warehouse, and a hospital is maintained, for employees and their families.

Production is about 1,000,000 lbs. copper, 500,000 lbs. lead and 3,000 kgs. silver per annum.

The mines and works of Sr. Proaño are interesting, not only because of their present importance and future promise, but also because constituting an exceptionally fine example of a thoroughly successful mining and metallurgical enterprise, conducted along sound lines, by a native of a country in which nearly all of the great mining enterprises are in the hands of European or North American managements.

**PRUNELLI (CORSE); SOCIÉTÉ ANONYME FRANÇAISE
DES MINES DE CUIVRE DE.**

CORSICA

Office: 51 Rue Vivienne, Paris, France. Mine office: Marignana, Corsica, France. Organized Dec. 29, 1906, under laws of France. capitalization 1,500,000 francs, shares 100 francs par. Lands include the Argentella group, carrying silver-copper ores associated with sulphides. Idle.

PÚQUIOS; COMPAÑÍA MINERA DE.**CHILE**

Office: Casilla 178, Valparaíso, Chile. Mine office: Atacama, Chile. E. J. J. H. Sandiford, chairman; P. H. MacClelland, vice-chairman; H. S. Sydney-Merritt, sec.-treas.; preceding officers, J. G. Kenrick and Walter Squire, directors; Archibald Stark, gen. mgr.; R. Benbow, mine supt. Organized Nov. 7, 1905, under laws of Chile, capitalization £100,000, and reorganized Jan. 8, 1906, capitalization £80,000, shares £1 par.

Lands, 44 claims, 144 hectares, show diorite cut by 3 fissure veins, with E.-W. strike, known as the Jefe, Repalon and Estaca lodes. These veins are intersected at nearly right angles by the Verde, Sofia and Farellón lodes. The intersection between the Jefe and Verde lodes has an ore shoot 30' wide. The Sofia and Jefe lodes are under development, latter, of 4' average width, traceable 2,500 meters, showing bornite and chalcopyrite ores with estimated average assays of 12% copper and up to 24 oz. silver per long ton, and traces of gold.

Development is by the old Farellón shaft of 693' the Estaca shaft of 595', the new Sofia shaft of 429', also by the 610' Sofia South tunnel, 612' Jefe East tunnel and 500' Jefe West tunnel, with a total of 3,140' of new workings, estimated to show 3,000 long tons of ore, with 1,100 tons blocked out for stoping.

Equipment includes 2 hoists, good for 900' each, and 2 Rand and Walker air compressors. There are several buildings, including an office, hotel, store and dwellings. Ores were sent to Caldera for reduction by the Ferrocarril de Copiapó, connected with the mine by a Bleichert aerial tram of 2 kilometers length. Fuel is Australian coal, costing 55s. per long ton.

Production was 295 metric tons of ore, from development work only, yielding 104,000 lbs. fine copper, 1907, giving an average return of 14.7% copper. The property experienced all sorts of trouble during 1908-09, and very little work was done for several years, but company was developing, with a small force at last accounts.

QUEBRADA; MINAS LA.**VENEZUELA**

Owned by South American Copper Syndicate, Ltd., Aroa, Venezuela. **QUEEN BEE COPPER MINING CO., N. L.** **NEW SOUTH WALES**

Head office: Australasia Chambers, Martin Place, Sydney, N. S. W., Aus. Mine in Robinson Co., N. S. W. Joseph Vickery, chairman; S. Pearl, S. Richards, J. R. Ratcliffe, T. E. Farquhar, directors; G. A. Loxton, mine mgr.; J. E. Crocker, legal mgr. Organized Dec. 15, 1903, and paid 13 dividends, aggregating £16,625, to Dec. 31, 1907. The company has been somewhat handicapped by lack of capital.

Lands, in the Bee mountains, parish of Narri, 11 miles southeast of Cobar, show a vein of 1 to 20' width, intermixed with barren streaks, the widest ore shoots being 5 to 10', with best shoot 3' wide and 120' long, carrying chalcopyrite, galena and sphalerite, assaying 1 to 2 oz. silver per long ton, with slaty gangue. The mine has a 713' main shaft, with bottom level at 670' with 500' of drifting. A new orebody of 4' average width and containing 4% copper is reported to have been opened up for over 200' on the 5th level, 1913. The ore carries no gold values and the mine has developed considerable sulphide ore of low average grade.

The smelter has 4 reverberatory furnaces of about 10 tons average daily capacity, and a 12-ton water-jacket blast furnace with a small Connorsville blower. Product is a 40% copper matte. This smelter, with its toy unit, has not given satisfactory results. Ores melted gave an average extraction of 7.75% copper.

Production was 1,104,320 lbs. fine copper in 1907; 1,486,240 lbs. copper in 1908; 8,328 long tons ore mined, and 8,501 tons smelted, yielding 946,720

lbs. copper, secured at a loss, in 1909. Average extraction, last half of 1909, was 5.4% copper. Very little production from 1909 to 1913, but manager writes that company plans erecting concentrating plant to treat the low-grade, silicious ores.

QUEENSLAND COPPER FREEHOLDS, LTD.

QUEENSLAND

Secretary and office: C. D. Comrie, 2 Broad Street Place, London, E. C., Eng. Mine office: Cloncurry, Beaconsfield Co., Queensland, Aus. T. G. Scott, chairman; C. K. Butler, C. H. McEuen and H. Edwards, directors; L'Estrange Nicolson, mgr.; Alex. Hill & Stewart, cons. engrs. Organized Jan. 31, 1907, under laws of Great Britain, capitalization £300,000, shares £1 par; issued £250,000, fully paid. Company holds a third interest in the Mountain Home Copper Co., Ltd.

Owens 8 freeholds, 378 acres, including the Malbon, Dobbyn, Diagonal and Argylla claims, in Cloncurry district, North Queensland, also a third interest in the Mountain Hope Copper Co., Ltd., about 600 acres, and a half interest in a further 40 acres.

The Malbon has been worked by leasers who have extracted about 84 tons of 33% copper ore. No ore of value was found below the 70' level, property resembling the "Duck Creek" mine being an E.-W. quartz lode with rich ore at surface, playing out between 50' and 100'. The Dobbyn is developed by 3 shafts, deepest being 75' showing an orebody averaging 7' wide, 150' long and assaying 20% copper. One hundred and fifty-one tons of 21.8% ore has been recovered and about 4,000 tons raised, averaging 28 to 45% copper. The Argylla is developed by a 100' shaft, showing 26' of ore in a narrow lens of quartz ironstone and kaolin, averaging 6% at bottom level. Diamond drilling to vertical depth of 926' proved 14' of 4% ore, which management might mine profitably with better transportation. The Mt. Hope has been drilled, but without good results and is now under exemption. The Diagonal claim is under lease; developed by 50' shaft producing 17 tons averaging 33% copper.

QUEENSLAND EXPLORATION CO., LTD.

QUEENSLAND

In liquidation, C. Dunlop Comrie, liquidator, 2 Broad St. Place, London, E. C., Eng. Described Vol. X.

QUILOMENCO SMELTER.

CHILE

Owned by Guillermo Echavarría, at Illapel, Coquimbo, Chile.

RAI MINE.

INDIA

Idle. Is an old copper mine in the Kumaon division of the Northwest Province, India, owned 1902, by Himalaya Mining Corporation, now dead. Property shows fissure veins capped by gossan, developed by 80' shaft, whose workings expose 4 small veins of quartz carrying chalcopyrite and bornite with impregnated wall rock. The ore proved too low grade to ship without cheaper railway transportation and mine is now closed down.

RAJDOHA MINE.

INDIA

Also called Rakha Hills mine. Owned by Cape Copper Co. and described under that title.

RAKHA HILLS MINE.

INDIA

Owned by Cape Copper Co. and described under that title.

RAMADILLAS SMELTER.

CHILE

Owned by Francisco Greve G., at Combarbalá, Coquimbo, Chile.

RAMMELSBERG MINE.

GERMANY

Office and mine: Goslar, Harz, Germany. Employs about 650 men. Bergrat Wolff, gen. mgr.; Geh, Bergrat Brauhing, mgr. of copper smelter. Property, owned jointly by the Prussian Crown and the Duchy of Brunswick, is a very ancient mine, worked since A. D. 972.

Lands, 2 miles S. of Goslar, carry 2 lenticular orebodies, of 15 to 50'

width and about 1,300' length each, with known depth of 400 meters, in Devonian slates. The ore is a dense mixture of chalcopyrite, galena, sphalerite and pyrite, with occasional tetrahedrite, gangue being mainly of barium sulphate and calcium-magnesium carbonate. The principal ore produced, called mixed ore, is estimated by the management to average 5 to 6% copper, 8% lead, 22% zinc, 5 oz. silver and 1 dwt. gold per metric ton. Non-zinckiferous copper ore is divided into 3 grades, first averaging 18% copper and 4.85% lead; second averaging 12% copper and 2% lead; third averaging 6% copper and 1.25% lead. The three grades of ore carry from 0.008 to 0.017% silver, and from 0.00011 to 0.00013% gold. All ores are slightly arsenical.

The mine is developed by shafts of 296 and 316 meters depth, and has upwards of 10 miles of workings, being estimated by the present management to have 5,000,000 metric tons of ore blocked out for stoping.

Present production about 32,500 metric tons of copper ore and about the same amount of lead ore averaging 11% pb., 22% zn. and 980 grams silver, annually.

The Okerhütte includes an electrolytic refinery and acid plant, annual capacity of latter being 25,000 metric tons of 50° Beaumé sulphuric acid. The electrolytic refinery has 600 tanks, with multiple arrangement of electrodes. Annual production of the Okerhütte is about 1,700 metric tons of fine copper, in various forms, and about 1,100 metric tons of bluestone. Production was 3,608,930 lbs. electrolytic copper, 1,074 metric tons bluestone, 5,239 metric tons lead, 11,522 kgs. silver and 96.5 kgs. gold, also quantities of various by-products including copperas, zinc sulphate, soda, etc., in 1902; 3,527,360 lbs. copper in 1905, and 3,600,000 lbs. in 1909. Present production is about 65,000 metric tons, annually, half of which are lead ores. The mine and works are managed with technical skill and success.

Equipment includes 2 hoists, good for 350 meters each, and a 30-drill air compressor, with necessary buildings. There is no mill, ores going direct to the smelter, after a limited amount of hand dressing.

The copper smelter, known as the Okerhütte, at Oker, is of 300 tons daily capacity, while lead ores are reduced at other works, known as the Juliushütte and Sophienhütte. The Okerhütte has 20 kilns and ovens for calcining, twelve 25-ton blast furnaces and five 15-ton reverberatory furnaces. The first-fusion product is a matte of 35 to 40% copper tenor, carrying 3 to 4% lead from the mixed ores treated, and this matte is roasted and resmelted. The Oker works produce also considerable speiss carrying about 51% copper, 35% lead, 1.8% zinc and 0.175% combined gold and silver, with traces of nickel and cobalt, also iron, arsenic, bismuth, antimony and sulphur. The finished products of the Okerhütte are blister copper and anodes.

RAMOS i RAMOS; JOSÉ TOMAS.

CHILE

Office and mine: Chalinga, Illapel, Coquimbo, Chile. Property is the Llamaco mine, showing large orebodies of 4 to 7% average copper tenor, well adapted to concentration. Property includes a small smelter. Production at last report, 155 metric tons of 22% ore, secured with 14 workmen. With rail communication and a modern reduction plant the property could be made a considerable producer.

RANDFONTEIN EXTENSIONS, LTD.

TRANSVAAL

Secretary and offices: E. A. Schneidau, Throgmorton House, Copthall Ave., London, E. C., Eng. Local office: 68 Commissioner St., Johannesburg, Transvaal, S. A. Hon H. A. Stanhope, chairman; F. Tripcomy and R. H. King, directors; G. E. Regis, mine mgr. Organized Oct., 1895, cap-

italization £200,000, shares £1 par; issued, 172,140. Accounts for year ending July, 1912, showed cash £2,145.

Company owns 95 copper mining claims in the Rustenburg district, as well as many gold and other claims. Management expects to dispose of its copper properties to a new corporation as the prospecting work thus far done has been promising.

RANEN COPPER CO., LTD.

NORWAY

Office: 24 Martins Lane, Cannon St., London, E. C., Eng. Sir. H. C. King, Col. C. F. Grantham, H. D. F. Baselow and A. Nichols, directors. Organized Jan. 24, 1913, capitalization £100,000, shares 10s. par. Is a reconstruction of the Holmholmen and Plurdalen copper companies.

RETIA MINING, POWER & RAILWAY CO., LTD.

AUSTRIA

Secretary and offices: E. T. Evans, 18 Ropemaker St., London, E. C., Eng. L. T. Held, W. Gosling and E. T. Evans, directors. Organized Nov. 1911, capitalization £300,000, shares £1 par; issued, 140,007. Property consists of the lands of the Kupfergewerkschaft Predazza Oss Matzurana, the silver-lead mines of the Gewerkschaft Toesens and Mons Argentarius Societa, in the Clara and Giulio mining districts, Austrian Tyrol.

RHOAB MINES OF RHODESIA, LTD.

RHODESIA

Secretary and office: G. E. C. Clark, 85 Gresham St., London, E. C., Eng. Mines in Rhodesia, South Africa. Hon. J. G. Jenkins, T. S. Horn, E. H. R. Trenow, directors. Organized April, 1911, capitalization £100,000, shares 10s. par; issued, 100,007, fully paid and 7 having 6d. paid.

Property consists of 20 claims, in 2 groups known as the Calcite and Calcite Extension in the Bubi district; 40 claims known as the West Glen Mav and the Sulphate, in the Bulawayo district and 30 claims known as the Zero and Carbonate in the Gwanda district.

RHODESIA CONSOLIDATED, LTD.

RHODESIA

Secretary and offices: Gold Fields Rhodesian Development Co., Ltd., 8 Old Jewry, London, E. C., Eng. Mines in Rhodesia, S. A. Major F. Johnson, chairman; W. F. Andrewes, R. G. Fricker, H. P. Clemes, W. Rhodes, J. P., Capt. Hon. C. J. White, directors. Organized in Rhodesia July, 1909, as a reconstruction of company of same name organized 1903; capitalization £700,000, increased Dec., 1910, from £550,000; shares 10s. par; issued and fully paid, 1,194,675. Shareholders were offered 1 share credited as 7s. 6d. paid for every old fully paid share held. Accounts for the 18 months ending March 31, 1913; showed loss of £10,099, reducing balance to £26,605.

Property includes over 600 claims in the East Rand and mining property in all parts of Rhodesia, also large interests in the Falcon Mines, In-siza Mines, Asp Gold, Sabi Gold, Rhodesia Mines Trust, etc., and the Headlands copper properties, N. E. of Salisbury, which are being developed. A number of mining claims were abandoned on the advice of its engineers in 1913.

RHODESIA COP. & GEN. EXPL. & FINANCE CO. LTD. RHODESIA

Secretary and office: T. Donald, 365 Salisbury House, London, E. C., Eng. Operating office: Bulawayo, Rhodesia. Mine office: Bwana M'Kubwa, Northwestern Rhodesia, S. A. Edmund Davis, chairman; Lieut.-Col. C. H. Villiers, P. Coventry Tarbutt, Herbert L. Stokes, J. E. H. Lomas and Dr. F. R. Harris, directors; W. G. Sheffield, metallurgist; Bechuanaland Exploration Co., Ltd., mgr. Organized Jan. 31, 1902, under laws of Great Britain, as Rhodesia Copper Co., Ltd., and title changed July, 1911. Capitalization £562,500, shares 7s. 6d. par; issued, 1,167,101 shares, fully paid. Shareholders were given new stock of 7s. 6d. par in exchange for old stock of £1 par, fully paid. The company owns about 400,000 fully paid shares in the Rhodesia Broken Hill Development Co., Ltd.; Kafue Copper De-

velopment Co., Ltd., and Bwana M'Kubwa Copper Mining Co., Ltd., controlling the latter through ownership of £146,250 stock, and holding large share interests in the other companies named. This company owns 12,500 "B" shares and £50,000 debentures of the Rhodesia-Katanga Junction Railway & Mineral Co., Ltd., and has a close working alliance with the Northern Copper (B. S. A.) Co., Ltd.

A dividend of 5% was paid in Aug., 1910. Accounts for year ending May, 1912, showed £558 loss, but for 1913, the profit was £5,027 which, added to previous credit balance, gives a total of £15,249 as of May 31, 1913.

In Sept., 1913, it was proposed to distribute the company's large stock holdings of subsidiary corporations among the shareholders. To accomplish this legally, it is planned that the capital of the company be reduced from £562,500 to £352,793 2s., and that such reduction be effected (a) by distributing in redemption of capital among the holders of the 1,172,512 shares (numbered 1 to 1,172,512 inclusive,) which have been issued, rateably in proportion to the shares held by them: 293,128 fully-paid shares of 10s. each of the Bwana M'Kubwa Copper Mining Co., Ltd; 53,296 fully paid shares of 5s. each of the Rhodesia Broken Hill Development Co., Ltd.; 53,296 fully-paid shares of £1 each of the Kafue Copper Development Co., Ltd., and £14-656 8s. in cash, but so that shares which, but for this provision, would be distributable in fractions, shall be sold by the company, and the net purchase money substituted for the fractions, and (b) by reducing the nominal amount of each of the shares in the company's capital, numbered 1 to 1,398,046 inclusive, from 7s. 6d. to 4s. 6d.

Lands are 640 sq. miles, or 409,600 acres, carrying both mineral and surface rights, within the bend of the Kafue river, including the Lishambeka, Wonder Rocks, Tungi, Eland, Kabulansuki and Kamiyobo mines. Company also owns a considerable number of farms, aggregating 126,000 acres; 1,140 mining claims; a three-fourths interest in 220 additional claims in northern Rhodesia, and the right to locate 4,020 further claims.

RHODESIA-KATANGA JC. RY. & MINERAL CO., LTD. RHODESIA

Secretary and office: L. Scotland, Friars House, New Broad St., London, E. C., Eng. Mine office: Kansanshi, Rhodesia, So. Africa. T. White, J. P., chairman; Robert Williams, managing director; J. H. Birchenough, C. M. G., M. White, C. F. Rowssell and G. Pauling, directors. Organized Jan. 25, 1909, under laws of Great Britain, capitalization £1,510,000, in £1-, 500,000 ordinary shares of £1 par, and 200,000 "B" shares of 1s. par; issued, £593,757 ordinary shares, and £187,650 "B" shares, fully paid. Debentures, £800,000 of 5½%, guaranteed by the Tanganyika Concessions, Ltd., convertible into shares at par, on or before Jan. 1, 1914; issued, £653,000. Company is a subsidiary of the Tanganyika Concessions, Ltd., and its property, the Kansanshi mine, is described under that title.

RHODESIA-KATANGA JC. RY. & MINERAL CO., LTD. RHODESIA

Secretary and offices: T. A. Henningsen, Dashwood House, London, E. C., Eng. Mines and lands in Rhodesia, So. Africa. J. Eustace, chairman, and P. Sanders, directors. Organized Dec., 1895, as successor of the Joint Stock Companies Agency, capitalization £250,000, shares £1 par; issued, 77,906, fully paid. Owns 8,600 acres farm land and shares in Copper Fields of Namaqua, New Rhodesia Mines, Ltd., and many other mining companies in Rhodesia.

RIBILLO; JUAN DE C.

CHILE

Mine office: Carrizalillo, Chañaral, Antofagasta, Chile. Property is the Yotesito mine, which produced 850 metric tons of ore annually averaging 15% copper, equivalent to about 275,000 lbs. fine copper, at last accounts.

RICA MINA (BAJO RIO TINTO); SOC. MIN. LA.

SPAIN

Mine near Berrocal, Huelva, Spain. Prince Pignatelli de Aragon, P. Duthie de la Tuque, A. Barthez, F. Fernandez and E. Wisse, directors. Organized Jan. 1, 1907, in Spain, capitalization 1,250,000 pesetas, 5 pesetas par. Owns the Rica mine. Idle.

RICHELSDORF I; KUPFERERZBERGWERK.

GERMANY

Mine office: Nentershausen, Hessen-Nassau, Germany. E. J. Enners, J. W. Piepmeyer, Otto Vetter, C. Julius Winter and A. Sternberg, directors. Has 1,000 shares. Lands, on Richelsdorfer mountain, are the Richelsdorfer and Karl-Alexander mines, showing cobalt and nickel ores, partially developed. No recent returns secured.

RIETFontein (T. C. L.), LTD.

TRANSVAAL

Office: Corner House, Box 4303, Johannesburg, Transvaal. G. C. Dammant, mgr.; B. I. Campbell, resident sub-mgr. This is a gold mining company, whose ores contain a little copper, enough to be troublesome in treatment, but not enough to treat for copper. Mine may possibly develop copper ore in commercial quantities with deeper workings.

RIO BLANCO SMELTER.

PERU

Owned by Peruvian Mining, Smelting & Refining Co.

RIO FARDÈS; SOC. ANON. DES MINES DE CUIVRE ET DE PLOMB ARGENT DU.

SPAIN

Probably idle. Office: 3 Place Royale, Brussels, Belgium. Mine office: Molinillos, Ciudad Real, Spain. August Dupont, E. Roth le Gentil, J. B. Cesari and R. Dufour, directors; H. M. Scherb, mgr. Organized July 1, 1903, under laws of Belgium, capitalization f2,500,000, shares f250 par, as successor of Société Anonyme des Mines de Cuivre et de Plomb Argentifère du Rio Fardès ci-devant Mines de Molinillo (Espagne). Annual meeting, first Monday in May. Lands, near Molinillos, carry silver-lead and copper ores.

RIO MURTIGA; SOCIÉTÉ DES MINES DU.

SPAIN

Mine at Encinasola, Huelva, Spain. Organized Jan. 7, 1904, under laws of France, capitalization f57,500, shares f250 par. The first company of this name was dissolved April 28, 1896. Owns the Santo Domingo and Santa Isabel mines. No returns secured.

RIO TAMBO, LTD.

PERU

Formerly at Poseo, Islay, Arequipa, Peru. Liquidated voluntarily, June, 1911.

RIO TINTO CO., LTD.

SPAIN

Secretary and offices: 3 Lombard St., London, E. C., Eng. Mine at Rio Tinto, Huelva, Spain. Works office: Port Talbot, South Wales. Chas. Wm. Fielding, chairman, Rt. Hon. Earl of Denbigh, Viscount Milner, P. C., G. C. B., G. C. M. G., John MacFarlan and John M. Macdonald, directors; Turquand, Youngs & Co., auditors; Walter J. Browning, mine mgr.; R. E. Palmer, asst. mgr.; G. W. Porteous, traffic, mgr.; Gordon Douglas, engr.; J. Angus, cons. engr.

Organized March 29, 1873, under laws of Great Britain, capitalization £3,500,000, increased, Nov., 1905, from £3,250,000, shares £5 par, in £1-, 625,000 cumulative 5% preference shares and £1,875,000 ordinary shares, fully issued and paid. The new issue of 50,000 ordinary shares, par £5, was sold to sharerolders at £63 per share, netting the company £3,150,000, for the redemption of an outstanding bond issue of £2,989,740, at 4%, which was fully retired. Transfer form, common; fee, 2s. 6d.; warrants to bearer are issued in denominations of 1 share, fee 6d., and 5, 10 and 25 shares, fee 1s.; fee for conversion into registered shares, 2s. 6d. per certificate. Stock Exchange settlement; all shares quoted in the official list. Fiscal year ends with the calendar year; accounts are issued in April, and an interim semi-

yearly report is issued in October. Dividends are payable in Paris by the Société Générale, 54 Rue de Provence.

Accounts for 1912 showed a gross profit on sales of £2,274,900 compared with £1,349,500 in 1911 and a net profit of £1,935,000 compared with £1,067,000 in 1911. Dividend was 90% in 1912 compared with 52½% the year previous and balance carried forward £194,600 compared with £28,300 in 1911.

Dividends were begun 1879, and have been paid continuously, varying greatly, according to net earnings. Dividends on the old ordinary shares, of £10 par, 1879 to 1896, ranged from 6s. in 1886 to 38s. in 1896. On the present ordinary shares of £5 par, dividends have ranged from 40% in 1897 to 110% in 1906. Dividends were small at first, because the company was seriously handicapped by 3 different sets of mortgage bonds, bearing 5% interest. In 1895 the mortgage debt was consolidated into a single issue of £3,600,000 first-mortgage debentures, bearing 4% interest, with a sinking fund and semi-annual redemption, which would have extinguished the mortgage in 1919, but, by the issue of new share capital, Nov., 1905, floated at the tremendous premium of 1,160%, the company placed itself in an impregnable financial position, the credit for this able stroke of finance having been due mainly to Mr. Fielding. Recent dividends on ordinary shares have been as follows: £3 12s. 6d., or 72½%, for 1901; £2 10s. or 50%, for 1902; £3 10s., or 70%, for 1903; £3 10s., or 70%, for 1904; £4, or 80%, for 1905; £5 10s., or 110%, for 1906; £4 7s. 6d., or 87½%, for 1907; £2 15s., or 55%, for 1908; £3, or 60%, for 1909, with an interim dividend of £2 10s. for 1910; £2 12s. 6d., for 1911; £4 10s., in 1912 and an interim dividend of 2s. 6d on preference and 40s. on ordinary shares in 1913. The company's dividends in 1912 were the greatest ever paid in 1 year by any copper mine. The company has a reserve fund of £500,000, of which £400,000 are invested in consols, and £100,000 are in choice selected shares. Gross income was £1,250,112, with expenses and losses of £232,127, in 1910.

Lands, 23,000 acres, freehold, of which 4,700 acres, were secured from the Spanish government, and 18,300 acres adjoining were purchased from private owners. Mining operations are conducted in an area of practically 5 sq. miles.

The Rio Tinto is the Methuselah of all known mines. The first semi-authentic account of the mines dates from the eleventh century before Christ, when the Phœnicians traded in copper made from its ores. Carthage, that vigorous young offspring of Tyre, succeeded to the hegemony of the Iberian mines, and worked the Rio Tinto mines extensively, for several centuries, being displaced, in turn, by the Romans, after the repulse of the second Punic invasion, and the total overthrow of the Carthaginian power. The Rio Tinto was worked by the Romans, for centuries upon a very considerable scale, and after the decadence of the Roman power the mines were operated in a very crude way by the Goths. Again the fortunes of war gave the Iberian peninsula to new masters and the Moors in turn were owners and operators of this great copper deposit. Following the expulsion of the Moors from southern Spain by Ferdinand and Isabella the mines fell into the hands of the Spanish and were reopened by them very early in the sixteenth century. The Spaniards, while among the world's best miners, and the pioneers of silver and gold mining in both North and South America, never paid close attention to copper or iron, and, even at home the Rio Tinto, although the property of the Spanish Crown, was worked, during its most successful periods, by foreigners, as it is to this day.

In the seventeenth century the mine became a considerable producer, under the management of a Swedish engineer named Wolters, and after his

death did fairly well under the direction of a French metallurgist named Tiquet. In the eighteenth century the mine was leased from the crown by a company of English adventurers, of whom the leading spirit was Lady Maria Theresa Herbert. During the chaotic period of the French invasion, early in the nineteenth century, the mine was abandoned, and, after being reopened, 1812, by the Spanish Crown, was worked in a small way only. For the next 60 years the mine was under the management of various lessees, until sold outright in 1873, to Matheson & Co., of London, for 92,800,000 pesetas, that firm organizing the present company, which has proven one of the most profitable mining corporations in existence.

The relics of the mining and smelting operations of the ancients are large, numerous and remarkable. The late Don Gonzalo Tarin, who was consulting engineer of the company and was closely connected with the mine for 40 years, beginning 1867, in his very able work, "Memorias," estimated the quantity of scoria remaining from ancient smelting operations, whether Roman or Phœnician, or both, at no less than thirty million metric tons, and his acquaintance with the property and its history and his opportunities of estimating and verifying these figures were perhaps better than those of any other man. Lying above slag piles left by the Phœnicians is a 10' bed of alluvium, on top of which are the Carthago-Roman slags. The smelting practice of the Romans apparently was very good, the slags left by them being as clean as those produced today. It is possible, however, that some of the copper left in the old slags has been leached out, during some 2,000 years of partial exposure to the elements, but it is the opinion of Señor Tarin that the slags were resmelted, in which case the latest modern metallurgical practice is but a repetition of the methods employed around the beginning of the Christian era.

The only remains of ancient mining tools and machinery that have been found at the Rio Tinto are 3 oak water-wheels, an oak ladder and some oak pitwork, with several bronze rims of kibbles, which presumably were of wickerwork. The iron tools undoubtedly have turned to rust in 2 millenniums, oak proving more enduring than iron. There also are many potsherds, including fragments of miners' lamps of the well-known classic pattern, and Roman coins are unearthed occasionally.

The Roman system of mining, so far as can be judged from the evidence offered by the Rio Tinto, was to cut narrow seams and slab off the ore in large masses, either by wedging or by the agency of quicklime tamped into the crevices and then wetted, and possibly both methods were used, these being the systems most generally employed previous to the adoption of gunpowder for blasting. The richer veins were followed persistently and the ancients were good judges of values, as has been learned by many a modern mining company that has reopened ore mines in Spain and Italy, in the hope of finding that much high-grade ore was left unmined. The Rio Tinto was not worked out because the deposit was too vast, but the rich ores of the secondary zone of enrichment were quite effectually extracted in all the old workings.

The Rio Tinto is situated in a rugged district, in a spur of the Sierra Andevallo, though the hills sometimes are held to be a spur of the Sierra Aracena, which itself is a branch of the famous Sierra Morena. The Rio Tinto, however, is separated from the Sierra Andevallo, which is some 12 miles distant, by the rivers Odiel and Járrama, and the mines are 51 miles by rail from the seaport of Huelva, in the province of that name, lying in the extreme southwestern corner of Spain, near the Portuguese boundary.

The orebodies of the Rio Tinto occur in mammoth lenses, with clay-slate on the S. and porphyry to the N., and are surmounted by large masses

of iron-ore gossan. The deposit has been leached to a depth of 100' where the zone of secondary enrichment begins, continuing to an average depth of 300'. Diamond-drill borings have shown untouched orebodies carrying upwards of 130,000,000 long tons of ore, giving sufficient reserves for about 60 years' production, and it is unlikely that the full extent of the orebodies available has been proven. The ore is of 2 classes, by far the larger part being slightly cupriferous pyrite, used largely in the manufacture of sulphuric acid, the second class consisting of copper sulphides disseminated in a silicified porphyry gangue. For removal of overburden there are 14 steam shovels, the largest having dippers of 4 cu. yds. capacity, and about 2,000,000 cu. meters of overburden is removed yearly, though this figure has been considerably exceeded in some years under exceptional requirements.

The ore produced is graded in 3 classes: (1) smelting ore carrying 4 to 6% copper; (2) export ore about 3.5% copper, and 45 to 50% sulphur; (3) leaching ore has 1.5 to 2% copper only. The average amount of copper contained in the ores treated has ranged from 1.5% copper, in 1876, the first year of production by the present company, to 3.234% in 1884. The output of the mine for 1912 was 2,406,969 tons carrying 2.18% copper. Tonnage has gradually increased for the last 5 years but the copper content has varied and is now higher than it has been for 2 years past. The ores carry an average of 1.5 oz. silver per long ton, with traces of gold, and considerable silver is saved, by the Claudet process, at the smelter. About one-third of the total production is exported for sulphur contents, about one-third smelted, and the balance either leached or sent abroad. The ores average 4 to 5% copper in the zone of secondary enrichment, and with depth decline gradually in value, until at about 1,000' depth the average copper tenor is only about 1.25%. The main orebody is cupriferous pyrite, carrying copper in the form of minute grains of chalcocite and chalcopyrite. Owing to the ore being unusually rich in sulphur the shipping ores of the Rio Tinto are in good demand, and in addition to supplying various British works the company exports washed sulphur ore in very large quantities to Germany, France, Belgium and a number of acid works in the United States. The reserve heaps at the mine are estimated to carry about 150,000 long tons fine copper.

The Rio Tinto has 3 mineral zones, carrying a succession of lenses, these being known as the South or Nerva lode, the San Dionisio or Middle lode and the North lode, in addition to which there are 2 smaller detached lenses adjacent to the North lode, which also are being worked opencast. There are 5 different mines, of which 4 are worked opencast and 1 underground. The underground mine is worked pillar-and-stall, with levels at intervals of 12½ meters, levels being opened 4 meters high and the entire floor divided into galleries and crosscuts of 4x4 meters, leaving pillars of 6x6 meters, which is not an entirely satisfactory method of extraction, leaving as it does more ore in the pillars than is mined.

The San Dionisio mine, the westernmost and deepest of the group, has a shaft of nearly 1,200' depth. The work of changing over the San Dionisio for opencast extraction was begun 1907, and completed 1911. The overburden, consisting principally of porphyry and slate, was removed by steam shovels and carried through tunnels on the different levels, similar work being done on the South Lode opencast extension. Ore will be mined by steam shovels to as great a depth as practicable, below which it will be necessary to hoist by shafts to the lowest tunnel level. The San Dionisio is likely to be the chief source of ore supply for several decades to come and work has been planned systematically for 10 years in advance.

Most of the ore mined is hauled out through tunnels without the need

of shafts or engines. The lowest tunnel now in use for the 2 main lodes, the South and Dionisio, has not proven deep enough and management plans driving a new tunnel, 200' below the present one, which will be 3 miles long, and will require 3 to 4 years for completion.

Wherever possible mining has been done by openpit workings which have the great advantage of giving complete extraction of the ore, and also are more economical in tonnage costs in the long run, though requiring enormous initial expenditures for the removal of overburden. Fortunately, the financial resources of the company permit the outlay of vast sums, the principal of which will not be repaid for many years but which eventually will be returned in full with very handsome interest. The possibility of using the caving system for underground mining was considered, but an adverse decision was reached. Timber is scarce and high priced. The depth of the largest pit is about 600' and beyond the great pit the immense orebodies are worked by drift-stopes, the capping being blasted and sent down the shafts to fill and hold the ground as the ore is removed. Steam shovels recently have replaced manual labor to a considerable extent in opencast ore extraction.

A central electric power plant, installed 1908, replaced a number of uneconomical steam installations. The mining equipment is adequate, but owing to extraction being mainly opencast the Rio Tinto lacks the powerful and spectacular mining machinery found at many other great copper properties, through no lack of enterprise, but owing to the company's fortunate position in requiring the minimum of such costly machinery.

Below the main pit are the roast yards, leaching bed, precipitation plant and smelter. The methods of leaching are described at length in the chapter on hydrometallurgy, in this volume. The average rainfall of the Sierra Morena, 1873-1905, was 28" yearly, but there are protracted seasons of drought, alternating occasionally with heavy rainfalls, hence extensive water storage is necessary, and there are large dams for this purpose, the last having been built 1907. The ore leached is no longer calcined, the copper becoming soluble by natural weathering, assisted by systematic sprinkling. About 7,000,000 gal. of leach-water, strongly charged with copper sulphate, are treated daily in the various lixiviation plants, yielding cascara, or copper precipitate.

The smelter, at the mine, built 1902, with American equipment throughout, treats a large proportion of ore on the ground, including considerable ore of a grade formerly leached. The smelter has two 42x160" elliptical water-jacket cupolas, 23' 4" over all in height, with charging doors 10' above the bottoms, which are detachable and mounted on wheels. Each furnace has 8 water jackets and 2 charging doors, ore and fuel being charged alternately. The furnaces have continuous discharge into 30-ton settlers, 12' in diameter and 40" high, which have continuous slag discharge. Furnace product is low-grade matte, of 29 to 34% copper tenor, taken in 8-ton ladles by electric traveling cranes to the converter department, where there are 6 stands, rotated hydraulically from a pulpit. Shells, 80x120", of horizontal barrel type, with spherical valves and 12 tuyeres each, are in 2 parts for convenience in lining, and are double-lined with a 4" external course of fire brick, rarely replaced, and an inner section, 22 to 26" thick, of ground silica and low-grade quartzose copper ores, with 10% of clay for a binder. When newly lined the shells have a capacity of only 3 to 4 tons each, increasing to about 8 tons when the inner linings are nearly burned out. The smelter product is converter bars, of 98 to 99% copper tenor.

There are 5 towns for employes built on the property of the Rio Tinto, and a large number of new dwellings were erected, 1909-10, to replace those

destroyed, early 1908, by subsidence of the workings of the South Lode.

The Rio Tinto employs about 15,000 men, in Spain, of which about 60 are British, earning average wages of 15 reals, equal to about 60 cts. per day of 8 and 9 hours. There is no Sunday work, and the men are paid daily. The population of the dual mining township of Rio Tinto-Nerva is about 30,000, and that of the port of Huelva, 25,000, hence it is estimated that the Rio Tinto Co., Ltd., is the direct source of support of 50,000 people in Spain and indirectly supports perhaps half as many more in Spain, England, and upon the Continent.

In Oct., 1913, 21,000 miners went on strike which only lasted a month so that the output was not seriously curtailed.

The mines are connected with the seaport of Huelva by the Rio Tinto-Huelva railway, a single-gauge line of 87 kilometers length, built 1873, by the company and slightly lengthened, 1908. This line does a general freight and passenger business, in addition to handling the company's heavy traffic. Huelva is built on the site of the old Phœnician city of Onoba, at the junction of the Tinto and Odiel rivers, known to the Phœnicians and Carthaginians as the Urium and Anas. The company has extensive railway terminals and wharves at the city and maintains a steamer service between this point and Wales.

The Welsh reduction plant, at Port Talbot, South Wales, is a modern smelter of good design and equipment, receiving material by sea from Spain, and having direct rail connection with the Great Western railway. Electric power is used throughout and there are 2 Temperley electric transporters for carrying bags of precipitate and bars into the ore sheds. The Port Talbot works have five 30-ton refining furnaces, top-charged by cars operated electrically with side-slag discharge. Slags from the reverberatories, carrying 4 to 6% copper, are resmelted in a water-jacket blast furnace. The cinder from the acid plant is treated by the Henderson wet process for the extraction of copper.

Production, 1876-1910, was 16,569,238 tons of pyrites shipped, and 33,190,235 tons of ore treated locally, a total of very nearly 50,000,000 long tons, this ore yielding 599,152 long tons fine copper. Copper produced at the mines amounted to 54,575,370 lbs. in 1909, and 51,049,600 lbs. in 1910. Production has been very regular, since 1891, with a minimum of 19,530 long tons in 1905, and a maximum of 24,364 long tons in 1909. Ore mined 1910 was 2,146,765 long tons, of which 637,020 tons were shipped direct, and 1,509,745 tons were reserved for local treatment, deliveries to customers amounting to 683,605 tons of sulphur ore and 578,443 tons of cupreous ore. The maximum copper production of the Rio Tinto was 80,214,400 lbs. in 1904, and recent production was 78,333,280 lbs. in 1909; 74,867,320 lbs. copper in 1910; 74,782,400 lbs. in 1911 and 89,432,000 lbs in 1912. Total copper produced since 1876 when company began business is 2,276,348,480 lbs.

The company has been co-operating with the leading American producers since 1910, in a policy of slight curtailment, of the supply of copper. Average cost formerly about 7 cts. per lb. now is only 6 cts. per lb. of finished copper, after deducting revenues from sulphur sold and miscellaneous sources. The management of the company is first rate both technically and financially, and the mine itself, after 3,000 years of production, requires no commendation.

RIPARBELLA, LTD.

ITALY

Office: 62 London Wall, London, E. C., Eng. Mine office: Riparbella, Tuscany, Italy. Lord Teynham, chairman; Sir T. D. Pile, Bart., Marquis O. B. di Castell-Bianco and F. D. de Mallortie, directors; G. T. Broadbridge, sec. Organized Dec. 31, 1907, under laws of Great Britain, as South Italy

Copper Mines, Ltd., and name changed, March, 1909, to present title, capitalization £300,000, shares £1 par; issued, £150,507, fully paid. Lands, 140 hectares in the Commune of Riparbella, Tuscany, acquired from M. Stephinger, in 1907. No record of operations secured.

ROBIN HOOD MINE.

QUEENSLAND

Situated in the Herberton gold and mineral field, Queensland. Flanagan Bros., owners. Developed by 60' shaft and 55' and 100' tunnels. Owners shipped about 100 tons of ore averaging 11 to 26% copper to the Chillagoe smelters, 1912.

ROEBOURNE COP. & GOLD MINES, W. A., N. L. W. AUSTRALIA

Office: Sydney, N. S. W., Aus. Mine office: Roebourne, Western Australia. Organized Jan., 1907, capitalization £40,000, shares 10s. par. Lands are the Carlow Castle group, leasehold, carrying 2 orebodies, said to show considerable gold and copper ore. No recent returns secured.

ROEBOURNE COPPER MINES, LTD. WESTERN AUSTRALIA

Secretary and offices: Henry Bacon, 62 London Wall, London, E. C., Eng. Mine near Roebourne, Western Australia, Douglas J. Neame, D. J. Paterson and E. Ronaldson, directors. Organized 1913, capitalization £150,000, shares £1 par; issued, 127,000.

Property, 4 leases, known as the Good Fortune, Good Hope, Fortune No. 1 and Fortune No. 2, 96 acres, 6 miles from Roebourne, the administrative center of West Pilbara district.

Claims show gabbro traversed by a schistose belt, or zone, containing green carbonates of copper and iron oxide. Property has been developed by numerous shafts showing 6 to 14' of ore. It is estimated that there are over 700 tons of 5½% ore opened along the outcrop; the average value of the ore now mined is 10% copper. The C shaft, 53' deep in Jan., 1913, showed an orebody 41' wide for a length of 130', averaging 8½% copper. Shipments to European smelters have returned from 22.92 to 30% copper, 5.447 oz. silver and 0.036 oz. gold.

Management plans sinking a shaft below water level to reach the primary ore and blocking out reserves of enriched ore. Property reported on by H. R. Sleeman, manager of the Whim Well Copper Mines, Ltd., who regards mine as a promising prospect.

ROGERS FREEHOLD COPPER MINES, LTD.

QUEENSLAND

Mine at Mt. Orange, near Mackay, Queensland, Aus. Organized Aug., 1907, in Queensland, capitalization £65,000, shares 10s. par. Controlled by J. Rogers, of Croydon, who bought mine for £2,000 and shares in the company. Claims comprise 200 acres on which development work was started July, 1912.

ROJAS; RAFAEL.

CHILE

Office and mine: Tres Puntas, Tocopilla, Antofagasta, Chile. Property includes Tres Puntas mines, showing a vein traceable 140 meters and opened to depth of 100 meters. Production about 200 metric tons of 17% copper ore per year, at last accounts.

ROMANERA COPPER CO., LTD.

SPAIN

Idle. Secretary and office: E. Ells, 37, Lime St., London, E. C., Eng. Mine office: Paimogo, Huelva, Spain. Geo. B. Mee, chairman and W. A. Stearns, J. P., directors. Organized Sept. 3, 1908, under laws of Great Britain, capitalization £110,000, shares 5s. par; fully issued and fully paid. This company was practically a reconstruction of the Anglo-Spanish Copper Co., Ltd., which was liquidated, 1910, compulsorily, and which in turn was practically the successor of the Spanish Copper Co., Ltd.

Lands, 16 claims, 440 acres, perpetual leasehold. Accounts for year ending Oct. 31, 1911, showed cash £10, debtors £605 and creditors £2,147,

which seems unpromising. Property was to be taken over by the Société de Saint Gobain Channy et Arey, a well known French company, in 1913, and is described under that title.

ROOIPUTS COPPER CO.

CAPE PROVINCE

Office: Bains Bldg., Johannesburg, Transvaal. Mine office: Upington, Gordonia, Cape Province. Chas. A. O. Bain, chairman; G. H. Poole, Gustav Sonn and W. J. Holmes, directors; H. Sothcott, sec. Organized Aug., 1908, under laws of Transvaal, capitalization £6,000.

Owms mining rights to the Farm Rooiputs, 13,400 morgen, equivalent to 25,000 acres, adjoining the Areachap property on the N., held under option from June 30, 1908, at £1 per month for first year, and £3 per month for second year, with right to remove all ore at 2s. 6d. per ton, during term of the option, and privilege of purchasing the mineral rights on the Farm Rooiputs for £10,000 and 500 shares in any company floated. Diamonds are said to have been discovered on the farm, and it is supposed to carry the extension of the Areachap orebodies.

RÖROS KOBBERVERK.

NORWAY

Office: Trondhjem, Norway. Mine office: Røros, Norway. Organized 1644, reorganized 1910 as a limited company, 2,064 shares, 600 kroner par. Nearest rail point is Harborg on the Røros line. Property, is a group of old mines including the Storvarts, Kongens, Kvintus, Sextus and Muggruben and is now the second largest copper producer in Norway. Dividend for 1912 was 6%.

The ore of the mines is cupriferous pyrite, ranging from 4 to 6% copper in the Kongens group, about 4% copper in the Muggruben and from 4 to 12% copper in the Storvarts mine, the pyritic ores averaging about 43% in sulphur.

Equipment includes an hydraulic power installation with electrical power transfer to all the mines. There are aerial ropeways of 2, 4½ and 9 kilometers from the mines. The smelter has water-jacket blast furnaces, giving a first fusion product of 37% copper tenor, which is blown up in Bessemer converters to black copper of 95.5% tenor, which is refined in reverberatory furnaces.

Production, 1,644 to 1,912 was 82,695 metric tons fine copper and 433,000 tons sulphur pyrites exported, having an aggregate value of upwards of \$35,000,000. Recent production has been 1,303,680 lbs. fine copper in 1898, 1,641,920 lbs. in 1904, 1,365,000 lbs. in 1907, about 10,000 metric tons of sulphide ore exported and 17,000 metric tons copper ore smelted, yielding about 1,800,000 lbs. fine copper in 1909; 12,700 metric tons of pyrites exported and about 15,000 tons copper ore smelted, yielding 1,300,000 lbs. fine copper in 1912.

ROSA HERMINIA MINE.

BOLIVIA

Situated in Canton Caquiaviri, Province of Pacajes, Bolivia. This mine was the only one active in the district during 1912. The workings, as yet shallow, develop a small vein of ore yielding a product carrying 35% copper when sorted.

ROSARIO; MINA.

CHILE

Mine office: Tamaya, Ovalle, Coquimbo, Chile. Is owned by the Familia Lecaros. Mine, opened 1850, is 590 meters in depth and produced, 1866-88, ore to the extent of 64,589 short tons, averaging 17.7 to 29.4% copper tenor. Idle some years, owing to decreased ore values at depth, and heavy timbering charges, but, with a railroad to Tongoi and modern equipment, can probably be worked to advantage.

ROSARIO; COMPAÑIA MINERA.

ARGENTINA

Idle. Mine at Calamuchita, Cordoba, Argentina. The mine has pyrite,

carrying chalcopyrite, with quartz gangue, averaging 5 to 6% copper. Has a smelter with a 36" blast furnace that made matte averaging 65% copper and 30 oz. silver per ton, sent to Great Britain for reduction and refining.

ROSARIO i PROVIDENCIA; MINAS.

CHILE

Mine near Chafarcillito, Atacama, Chile, shows 2 parallel orebodies, averaging 8 to 10 meters width, in diorite and limestone, traceable for some distance, 1 showing oxidized ores of copper, associated with spathic iron, these averaging about 4% in tenor and requiring concentration. The second vein carries only oxidized ores, to depth opened, averaging about 5% copper. Ores are free smelting and are sent to Tierra Amarilla for reduction. Production was about 450 metric tons of ore, averaging 16%, equivalent to about 160,000 lbs. fine copper, yearly, at last accounts.

RÖSTVANGEN GRUBER; AKTIESELSKABET.

NORWAY

Office: Christiania, Norway. Mine office: Kvikneskogen, Røros, Trondhjem, Norway. Joh. Didrichsen, chairman; N. Persson, vice-chairman; J. Chr. Bisgaard, sec.; preceding officers, Kr. Johanssen, L. Bjønness, and Fr. Langaard, directors; Carl Dahlberg, gen. mgr.; B. Bredesen, mill supt. Organized May 18, 1908, under laws of Norway, capitalization 1,000,000 kroner, fully paid. Annual meeting, last of March.

Lands, 170 claims, showing mica-schists and gabbro, carrying 9 orebodies, with N.-S. strike, between mica and amphibolite schists. There are 2 veins under development, of 4 to 14 meters estimated average width. These veins carry pyrite and chalcopyrite ore estimated by the management to average 2.5 to 4% copper and 46% sulphur. The mine is developed by over 3,000' of workings including tunnels of 140 and 350 meters length, estimated to show 250,000 metric tons of ore, with 150,000 tons blocked out for stoping.

Equipment includes a 1,500-h. p. hydraulic installation, with 120-h. p. electric and 120-h. p. gasoline plants. There are two 66-h. p. hoists, and the company owns 29 buildings, including 2 stores and has a sawmill. The concentrator is of 200 metric tons daily capacity. The mine and mill are connected with the Trondhjem-Kristiania railway by a 22½-kilometer aerial tram. Production was 33,000 metric tons of ore, estimated by management to have averaged about 3.5% copper, 1909, and about 30,000 metric tons of ore in 1910, giving estimated productions of 2,000,000 lbs. fine copper in 1909, and 1,850,000 lbs. in 1910. Mine yielded 26,893 tons of export ore in 1912, of which 23,896 tons were shipped. The stock pile at the mine had 72,000 tons and the quay at Trondhjem 14,000 tons of ore in June, 1913. The management plans opening about 500 meters of tunnels and shafts, adding an air compressor, and completing the equipment of its 200-ton concentrator.

RUDIANSKI MINES.

RUSSIA

Owned by Nijni-Tagilsk Mines & Works, Bogoslovsk, Russia, and described under that title.

RUESGA; SOCIEDAD ANONIMA COBRES DE.

SPAIN

Idle. Office: Bilbao, Spain. Mines near San Martín de Los Herreros, Palencia, Spain, and Dehesa de Montojo, León, Spain. Don Julio Lazúrtigui, pres.; Don Augustin Cortina, sec. Organized 1901, capitalization 1,500,000 pesetas, shares 500 pesetas par. Property includes the Leonora and adjoining mines.

RUTHERFORD COPPER MINING CO.

TASMANIA

Idle. Mine office: Burnie, Russell Co., Tasmania. Ore said to average 7.5% copper.

SAAVEDRA i BESA.

CHILE

Mine office: Quebradita, Freirina, Atacama, Chile. Cornelio Saavedra and Alfaro Besa, owners and managers. Lands, 3 hectares, 27 kilometers

from Peña Blanca, showing a fissure vein in granite of about 5' average width, with strike of N. 42° E., and 66° dip. The vein opened to 1,370' in depth and for 886' along its course, shows an oxidized zone 131' deep, succeeded by sulphides, mainly chalcopyrite with quartzose gangue, averaging 16% copper. Water is encountered at 110'. Equipment includes a steam plant with three 70-h. p. boilers, and an electric plant for lighting and actuating pumps and the mill.

SADO MINE.**JAPAN**

Owned by Mitsu Bishi Goshi-Kwaisha.

ST. DAVID'S GOLD MINES (1903), LTD.**WALES**

Office: 29 Cornhill, London, E. C., Eng. Mine office: Barmouth, Merionethshire, Wales. Godfrey C. Isaacs, chairman; James Junner, sec. Organized July 21, 1903, under laws of Great Britain, as a reconstruction of St. David's Gold & Copper Mines, Ltd., capitalization £60,000, shares 5s. par. Debentures, £40,000, authorized, at 6%; issued, £10,750. The old company paid dividends of 70%, and the present company paid 1 dividend of 3d. per share, July 11, 1904, and Feb. 15, 1905.

Lands, 800 acres, carry gold and copper ores. Equipment includes a 50-stamp mill and an Elmore vacuum oil flotation plant.

SAINT GOBAIN CHANNY ET AREY; SOCIÉTÉ DE.**SPAIN**

Office: Place des Sanssaies, Paris, France. Company was organized for the purpose of acquiring the property of the Romanera Copper Co., Ltd., which was practically a reconstruction of the Anglo-Spanish Copper Co., Ltd., which in turn was the successor of the Spanish Copper Co., Ltd., and thus putting an end to protracted litigation which has involved these companies since the first reorganization.

Lands, 180 hectares, about 444 acres, perpetual leasehold, including La Carolina, La Infanta, La Fronteriza San Vicente and other mines, in the Paimogo district, lying between the Tharsis mine and the Rio Chanza.

The San Vicente mine is said to carry about 3 miles of the strike of the San Vicente vein, a low-grade copper deposit of about 20' average width, reported by former operators to have given assays of 2.71% copper, 28.1% sulphur, 1 dwt. gold and 2 oz. silver. The property also shows 6 contact deposits, between porphyry and clayslate of which 3, opened by shallow shafts, are said to average 30' in width and 500' in length. The San Vicente is supposed to have been opened by the Phœnicians, and was reopened 1862, 1872, 1883, 1901, and 1905. The mine has about 1 mile of workings, and apparently has been quite stoped out above the adit level, where there is an 1,800' tunnel.

The Valrubio group, at Paimogo, includes the Valrubio, San Carlos and San Andrés mines; lying between the San Vicente and Monterubio groups, and said to carry the western extension of the San Vicente vein system, but apparently this group is on the strike of the quartz-porphyry vein system running from Sierracilla to San Bonito, with narrow veins of low-grade complex ore. La Carolina and La Infanta mines are undeveloped, but the former has shown ore giving assays up to 30% copper, and La Infanta was claimed, by the Anglo-Spanish Copper Co., Ltd., to have ores giving assays of 4% copper and 12 oz. silver per metric ton.

The property of this company as a whole lacks cheap transportation being 5 miles from the Guadiana railway, and as the ores are complex, low in metal tenor, and difficult of treatment, the future of the mines of this zone depends mainly on utilization of the sulphur values.

ST. MUNGO COPPER MINES, LTD.**QUEENSLAND**

Office: Bow St., Charters Towers, Queensland. Mine office: St. Mungo, Cloncurry, Queensland. Angus McCallum, chairman; A. R. Graham and R. J. Hand, directors; D. M. Leyden, sec.; Jas. Matheson, mgr. Organized

Dec. 11, 1909, under laws of Queensland, capitalization £5,000 10s. par, increased July, 1912, to 40,000 shares with par value reduced to 2s. 6d.; fully issued and fully paid. Dividends were 60% in 1911 and 80% in 1912. Cash assets Aug. 1, 1912, were £2,318.

Lands, 50 acres, leasehold, in the Cloncurry district, 22 miles from a railway. Country rock is granite. The mine is opened by a 162' shaft, with about 240' of workings, showing chalcopryite ore with about 23% copper and \$2 gold per ton. There is no power equipment, but the installation of an oil-burning engine was planned, July, 1913.

ST. NEOT MINING SYNDICATE, LTD.

ENGLAND

Liquidated. Formerly at Liskeard, Cornwall, Eng. See Vol. X.

ST. SYLVESTER; SILBERBERGWERKE.

GERMANY

Office: Strassburg, Germany. Mine near Markirch, Elsass-Lothringen, Germany. Frédéric Gross, Léon Ungemach, Emil de Bary, Paul Lacour, Dr. Julius Schaller and Josef Vogt, directors; Paul Ferdinand Werner and Dr. Heinrich Ungemach, executive committee. Organized 1909, under laws of Germany, capitalization 450,000 marks, shares 450 marks par, as successor of Weilerthaler Bergwerke G. in. b. H., taking over all assets of that company for 225,000 marks, in stock, and giving, in addition, 627 shares of common stock, with provision that these additional shares shall participate in distribution of net earnings, after allowing for depreciation and other charges, including dividend deduction of 5% on regular stock, one-half of profits going to holders of the 627 shares of common stock.

Lands include the St. Sylvester mine, having a 53-meter shaft, and the Donner and Katz mines, carrying argentiferous gray copper and antimony ores. Idle several years.

SAM EYDE CO.

NORWAY

See Norske Aktieselskap für Elektrokemisk Industri.

SAN AGUSTIN; MINA.

CHILE

Mine office: Los Bronces, Los Condes, Santiago, Chile. Mine, opened to depth of 426', has irregular workings owing to orebodies being considerably broken and faulted, but the ore developed is of good tenor. The dump has about 20,000 metric tons of 5% ore, valueless at present, but of a sort highly suitable to wet concentration. The mine has no machinery, and used mules for transportation, at last accounts, employing about 70 men. Ore produced is sold to the Maitenes smelter of the Compañía Esplotadora de Lota i Coronel.

SAN BARTOLO; SOCIEDAD.

CHILE

Office: Calle de Compañía 1213, Santiago de Chile. Mine office: San Bartolo, Antofagasta, Chile. Luis Claro Solar, chairman; Guillermo Subercaseaux, vice-chairman; José Luis Santa María, sec. and Carlos Larrain Claro, directors. Organized Aug. 8, 1905, under laws of Chile, capitalization £120,000, shares £1 par.

Lands show 5 sandstone beds, carrying disseminated native copper. Equipment includes a 200-ton mill of modern design, built 1908, equipped with 2 Blake crushers, 3 Chilean mills, 2 sets of rolls, 2 jigs and 12 Wilfley tables. Property considered promising. Idle several years, company's funds having given out.

SAN CRISTOBAL MINING CO.

SANTO DOMINGO

Office: 807 Baily Bldg., Philadelphia, Pa. Mine office: San Cristobal, Santo Domingo. I. B. Thorn, pres.; F. M. Justice, vice-pres; Walter Smedley, sec.-treas.; Dr. E. Fahrig, cons. engr.; preceding officers, A. R. Justice, José DePool, A. L. Earnshaw, H. B. Wall, E. J. Hedden and W. E. Jackson, directors. Organized May 12, 1909, under laws of Arizona, capitalization \$2,325,000, shares \$100 par, nonassessable; issued, \$1,500,000. Bonds

are prohibited by the charter. Logan Trust Co., Philadelphia, registrar and transfer agent. Annual meeting, first Wednesday in June. Company has a share interest in the Blanton Copper Mining Syndicate.

Owens upwards of 250,000 acres, freehold, mainly timbered, in the San Francisco district. The management reports that its property carries malachite and azurite in the surface zone, succeeded by chalcopyrite and bornite at depth, ores being estimated to average 3 to 6% copper, 2 oz. silver and \$2 gold per ton. Smelter shipments of 138 tons of well selected ore returned \$24.44 copper values, and \$12 gold per ton.

The company is not directly engaged in mining, preferring to sell or lease tracts to others for either cash, or a share interest in the vendee company. Is not favorably regarded.

SAN DOMINGOS; MINA.

PORTUGAL

Owens by Mason & Barry, Ltd., at Pomaraõ, Alemtejo, Portugal.

SAN JUAN; SOCIEDAD MINERA.

CHILE

Office: 55 Calle Prat, Valparaiso, Chile. Mine office: Higuera, Coquimbo, Chile. Guillermo Lyon, pres.; José María Muñoz, managing director; E. A. Sandiford, Ruperto Alvarez and Cirilo Armstrong, directors; Miguel Scantlebury, gen. mgr.; Ricardo Spargoe, mine supt.; Ricardo Everett, smelter supt. Organized Feb. 17, 1906, under laws of Chile, capitalization 1,000,000 pesos, in 300,000 pesos preferred and 700,000 pesos common shares, par 20 pesos, 10 pesos paid in. Semi-annual meeting, March and September.

Lands, 66 hectares and a 9-hectare mill site, known as Ají é Anexas, at Minas Casas. The property shows syenite and diorite, cut by several fissure veins with E.-W. strike, dip of 60°, and widths of 5 to 10'. The main vein, of about 2 meters average width, yields sulphide ore of 6 to 7% copper tenor. Development consists of the following shafts: Las Casas of 70', Ají of 500', Aguilas of 240', Rosario of 300', Cocinera of 240', Capriciosa of 700', San Juan of 1,200', Ierma of 200', and San Pablo of 600'. The mines were opened 1820, and have been in continuous operation since, being among the oldest copper producers of Chile.

Equipment includes a 100-h. p. power plant, with 6 hoists, said to be good for 1,000' depth each, and a Siemens & Halske generator for lighting, and driving 4 electric drills. Buildings include a machine shop, carpenter shop, smithy and about 50 dwellings for employees.

There are 2 smelters, having a combined capacity of 230 metric tons daily. The San Juan smelter, connected with Las Casas mine by a 1,069-meter aerial tram, has five 16-ton reverberatory furnaces and 12 kiln calciners. The Nuevo Porvenir smelter, at Higuera, in the valley about a mile below the mine, has a 120-ton rectangular blast furnace, burning bituminous coal and making 50% matte, sent to the Guayacán smelter for conversion, the nearest shipping port being Totoralillo, 12 miles distant, with 7 to 8 pesos per metric ton transportation charge.

SAN MIGUEL COPPER MINES, LTD.

SPAIN

Secretary and office: R. L. Rodger, 738 Salisbury House, London, E. C., Eng. Mine office: Almonáster, Huelva, Spain. C. C. D'Anvers, chairman; Dr. N. Brückner, managing director; H. Schmitz, M. Paisant, N. Brown, A. Harter and C. A. Massasuti, directors; F. O. Harvev, cons. engr. Organized Oct. 12, 1904, in Great Britain, capitalization £150,000, shares £1 par; increased, Nov., 1908, to £200,000; fully issued and fully paid. A former debenture issue of £75,000, at 6%, was redeemed, 1905. Dividends were 18¾% in 1906 and 7½% in 1912. Accounts for 1912 showed a profit of £18,389. Reserve fund was £50,000 in 1912.

Lands, 1,900 acres, including the San Miguel and adjoining mines of cupriferous pyrites. The property was worked, for some years, by Sociedad

Mineira de San Miguel de Huelva, a Portuguese company, until taken over 1904, by the present owners. In 1907 the opencast levels of the mine caved, since which time production has been limited to underground ore extraction. The mine has ore reserves, estimated, 1912, at 700,000 long tons, and in addition there are about 450,000 tons of partly leached ore on surface, in heaps. Underground ore reserves are estimated at 2.5% copper tenor.

The company owns a 12-mile private railway, built at a cost of £40,000, from Almonaster to El Cerro connecting at the latter point with the Ferrocarril Zafra y Huelva.

Production has been as follows: 1,612,800 lbs. copper in 1904, 978,880 lbs. in 1906, 797,440 lbs. in 1907, 1,124,480 lbs. in 1908, 1,438,080 lbs. in 1909, 1,635,200 lbs. in 1910, 1,729,280 lbs. in 1911, and 1,422,400 lbs. in 1912.

SAN PEDRO; SOCIÉTÉ ANONYME DES MINES DE.

SPAIN

Office: 28 Rue de Châteaudun, Paris, France. Mine office: Zalamea La Real, Huelva, Spain. M. E. Ascherson, chairman; J. Mesnier, H. Prévost and A. Taraud, directors; Carlos Marchal, agt., at last accounts. Organized Feb. 27, 1899, under laws of France, capitalization f450,000, increased later to f600,000, shares f100 par. Lands include the Barranco de los Buyes group of 10 old mines, 167 hectares.

SAN PLATON; COMPAGNE DES MINES DE CUIVRE DE.

SPAIN

Office: 7 Rue Pillet-Will, Paris, France: Mine office: Almonáster, Huelva, Spain. Guillermo Sundheim, manager, at last accounts. Organized Oct. 18, 1906, under laws of France, capitalization f3,000,000, shares f100 par. Paid dividends of 5% in 1907 and 5% in 1908.

Lands, 46 hectares, including the San Platon, Segundo San Platon and Aumento de San Platon mines.

SAN RAMÓN DE FREIRINA; COMPAÑÍA MINERA.

CHILE

Office: Santiago de Chile. Mine office: San Juan, Atacama, Chile. Organized 1904, under laws of Chile, capitalization 160,000 pesos, shares 100 pesos par. No trace of operations secured.

SANTA BÁRBARA; CIA. INDUSTRIAL y MINERA DE.

PERU

Mine office: Yauli, Junín, Peru. Dr. Octavio Valentine, manager, at last accounts. Property is a custom smelting plant, 112 miles from Lima, at an elevation of 13,420' above sea level, 6 miles from Morococha by trail and about 25 miles by rail. Ore is received mainly by llamas, which carry average loads of about 110 lbs., and the railroad finds it difficult to compete with the llamas, owing to heavy grades and the great cost of rail construction. The plant includes a small calciner, hand reverberatories, and 3 water-jacket blast furnaces of 25, 50 and 100 tons daily capacity. There is a 20-ton Krupp ball mill, jigs, spitzkasten, centrifugal separators and dryer, a 6' pulp mill and a Van Meter oil concentrator. Power is furnished by a 60-h. p. turbine.

SANTA CECILIA COPPER MINING CO., LTD.

ENGLAND

Dissolved, 1901. No trace of operations obtained.

SANTA INES MINING CO., LTD.

PERU

Former mine office: Morococha, Junín, Peru. No trace of operations secured, and apparently abortive. See Vol. X.

SANTA INES y MOROCOCHA; COMPAÑÍA.

PERU

Office: 193 Calle de Aparicio, Lima, Peru. Mine office: Morococha, Junín, Peru. Roberto Pflucker, pres.; Leopoldo Pflucker, vice-pres.; Porfirio Silva, sec.-treas.; Vicente Pazos y Sacio, gen. mgr.; León Torres, mine supt., at last accounts. Organized under laws of Peru, capitalization 1,200,000 soles.

Lands, 120 claims, 240 hectares, and the Hacienda Morococha, 6,000 hectares, in the Tuctu district. Mineral lands are in the Morococha basin, which has 4 large lakes, connected by streams with waterfalls available for

power purposes. Mines include the San Francisco and San Miguel, carrying fissure veins and contact deposits between limestone, diorite and quartz-porphry. The veins, though narrow, averaging but 3' or so in thickness, carry persistent paystreaks of rich ore characterized by sulphoarsenide copper ores, ranging up to 25% copper and 16 oz. silver per ton.

Development includes the 985' Ausiliar, the 1,968' Media Falda and the 2,625' Laguna tunnels, with about 9,841' of workings. Ore produced is sorted into 2 grades, averaging 44.18% and 13.86% copper, respectively, and for the first 6 years of operation, ore averaged 25.78% copper and 330 grams silver per ton after selection. The mine is reached by the Ferrocarril Central del Peru.

Equipment includes a hydro-electric installation, with a 40-kw. Siemens Halske generator for light and power, and 3 electric drills. Fuel is domestic coal costing about 9 pesos per ton, and cost of mining was given by company as averaging about \$2.50 per ton, ore being dressed to an average copper tenor of about 25% and sold to the Casapalca smelter. There also is a small gold mine, known as the Santa Ines, at Castrovirreyna, Huancaavelica, Peru, having a 6-ton amalgamating plant.

At last accounts the property was under option to Messrs. Haggin and McKim, apparently for the Cerro de Pasco Co.

SANTA RITA DE ARQUEROS; SOCIEDAD MINERA. CHILE

Office: Santiago de Chile. Mine office: Arqueros, Coquimbo, Chile. Organized Dec. 12, 1905, under laws of Chile, capitalization 400,000 pesos, shares 50 pesos par. No trace of operations securable.

SAYAPULLO; COMPAÑIA MINERA. PERU

Office: Mogollon, 13, Lima, Peru. Mine office and works: Visto Bella, Sayapullo, Peru. Jose Balta, general manager. Organized Oct., 1908, in Peru, capitalization £75,000, shares £1 par, increased 1909, to £88,500.

Lands, 840 claims, on Sayapullo mountain, and 1,020 claims in the Huay-day coal fields, about 50 miles from Salaveery, the nearest rail point.

The Sayapullo property carries a number of parallel veins, traceable 2,000 meters, principal development being on 2 veins of about 12 meters width, showing up to 10% copper, 60 oz. silver and small gold values.

The coal property is extensive, showing 5 distinct veins, dipping at about 30°, and aggregating 8 meters in thickness. The coal is said to be anthracite of good quality.

Equipment includes a 30-ton smelter, with a 30x36" water-jacket blast furnace, erected 1910.

Property was under option to a French syndicate, at last reports.

SCAMANDER COPPER MINES, N. L. TASMANIA

Office: Royal Bank Chambers, Melbourne, Aus. Mine address: Scamander, via Mt. Balfour, Tasmania. Wm. Rain, chairman; J. S. G. Wright and P. J. Deely, directors. Capitalization £35,000, shares £1 par; issued 33,000 shares.

Lands, 160 acres, 8 miles from Scamander, formerly worked by the Balfour Proprietary Co. Development consists of several old shafts and tunnels, and a new shaft, 150' deep, showing silver-copper ore.

SCHULZ & WEHRENBOLD JUSTUSHÜTTE. GERMANY

Mine and works office: Weidenhausen, Hessen-Nassau, Germany. Property includes the Schulthalsberg mine, carrying iron and copper ores, and the Königsgrube, Siegenbach, Fides and Hainau iron mines. Smelter has 1 cupola only. Idle.

SCHWARZWÄLDER ERZBERGWERKE; GEWERKSCHAFT. GERMANY

Office: Freiberg, Germany. Mine office: Littenweiler, Baden, Germany.

Eduard Dahmen, Hermann Behrens and Jean Balthaser, executive committee; Max Reichard, supt. Company has 1,000 shares of unassigned value. Mines have silver-lead, zinc and copper sulphides. Equipment includes steam power. Mine and mill are connected by an aerial tram. Employed 200 men at last accounts. Production is about 300 tons of concentrates yearly.

SCOTTISH NORTH QUEENSLAND

EXPLORATION CO., LTD.

QUEENSLAND

Office: 16 Bothwell St., Glasgow, Scotland. J. M. Lochhead, secretary. Organized Aug. 19, 1907, under laws of Great Britain, capitalization £10,000, shares £1 par. Debentures, £5,000 authorized, £4,170 issued.

Lands, in the Klondyke district, Chillagoe, Queensland, were sold 1912, to the Mammoth Copper Mine, Ltd., for £350 cash and £5,500 in fully paid shares.

SEBORUCO MINES.

VENEZUELA

Property, near Seboruco, consists of a group of claims covering red sandstone hills that flank the main mountain range. These red sandstones contain 8 intercalated conglomerate beds, which vary from 1½ to 2½' thick, dip at 70° and carry copper glance and oxidized ores replacing vegetable matter associated with lignite. Ore is low-grade and cannot be profitably worked under present conditions.

SECRET COPPER MINING CO., N. L.

NEW SOUTH WALES

Mine office: Illewong, N. S. W., Aus. Jas. Wilson, manager, at last accounts. Organized Dec., 1907, under laws of New South Wales, capitalization £1,200, shares £10 par. The mine has a 250' shaft. Presumably idle.

SEIBAL; SOCIÉTÉ ANONYME DES MINES

DE CUIVRE DU.

BRAZIL

Office: 40 Rue de Chabrol, Paris, France. Mine office: Camaquã, Capava, Rio Grande do Sul, Brazil. Al. Fluert, president. Organized 1903, under laws of France, capitalization 415,000 francs, shares 100 francs par. Property, near the Camaquã mine, carries gold and silver-copper ore, and associated minerals. Idle.

SELLHEIM SILVER & COPPER MINES, LTD.

QUEENSLAND

Office: Darragh's Bldgs., Queen St., Brisbane, Queensland, Aus. Mine office: Sellheim, Sellheim Co., Queensland, Aus. F. W. Cröwe, secretary and manager. The property, near Sellheim, held under application for a mineral lease, is idle, and has not been worked for some years. Not favorably regarded.

SENZE COPPER MINE, G. m. b. H.

PORTUGUESE W. AFRICA

Office: Bremen, Germany. Mine office: Senze do Itombe, Angola (Portuguese W. Africa). Fr. Oloff, chairman; F. W. Meyer, vice-chairman; P. Barckhan, C. A. Wuppesahl and E. Haas, directors; C. H. Cremer, mgr. Organized April 26, 1910, under laws of Germany, capitalization 200,000 marks, shares 2 marks par.

Lands, 2 kilometers from Senze do Itombe, and 192 kilometers from Loanda, show a 5-meter bed of calcareous sandstone, dipping at about 20°, said to carry about 5% copper. Property was worked intermittently under former owners.

SEOUL MINING CO.

KOREA

Office: 418 First National Bank Bldg., Denver, Colo. Mine office: Hol-Kol, Hwang-Hai, Korea. H. Collbran, pres.; W. D. Townsend, vice-pres.; H. E. Collbran, sec.-treas.; A. H. Collbran, gen. mgr. and mg. engr.; preceding officers, J. S. Collbran, F. B. Lawson and S. L. Selden, directors; R. Blainey, mine supt.; F. F. Bostwick, purch. agt.; H. E. English, mach. supt.; F. C. Brown, mill supt., and J. P. Manning, chemist-assayer. Organ-

ized April 27, 1908, under laws of Connecticut, capitalization \$500,000, shares \$100 par; issued 4,000 shares. Dividends have been 25% in 1910; 50% in 1911; 50% in 1912, and 25% for the first half year of 1913, making a total of \$600,000 to July, 1913. Bankers Trust Co. of New York, registrar. Annual meeting, third Monday in October.

Statement submitted Feb. 10, 1913, shows total receipts, \$620,055 for 1912, compared with \$551,470 in 1911. Expenditures were \$263,708 and profit \$356,347 in 1912, compared with \$339,844 in 1911. This gives a 57.4% profit out of the gross receipts.

Company has a lease on the Suan concession, granted, Nov. 4, 1905, to the Korean Syndicate, comprising a tract of land 13x20 miles in extent, about 52 miles from Pyeng-Yang. The concession carries full rights to examine, develop and operate all mines and deposits contained within the area covered by the grant. Company also has permission to cut timber and to use all the water required for mining, milling and other purposes from sources within, or adjacent to the district. These privileges are given for a royalty of 1% on the gross value of the output of the mines. There is an additional annual tax of about 30 cts. per acre (50 sen for each 1,000 tsubo), on all land actually selected for mining operations, such selections to be made at any time before July 1, 1916.

The rights in this concession are secured to the Seoul Mining Co. by an agreement made with the Korean Syndicate which provides for the payment of 8% of the actual profits derived from the concession, clear of all depreciation charges, in addition to a 20% share interest in the Seoul Mining Co.

The property shows both granite and limestone, the principal orebody, known as the "Collbran Contact," lying between limestone and a batholith of granitoid rock. Ores carry gold, copper and bismuth, the gold seldom being visible and rarely in coarse condition. Silver is also present, alloyed with the gold to an appreciable percentage. The copper ores contain chalcopyrite, bornite and tetrahedrite, with a high gold content, of fair average, probably being about 1.5% copper and \$12 gold. The orebodies are irregular and in general parallel with the limestone-granite contact, connected more or less by generally well-defined fissures. The gangue is a highly silicious crystalline limestone, altered by contact action and containing a considerable amount of magnesia and alumina.

Ore reserves—

	1909.	1910.	1911.	1912.
Tons	172,450	190,100	211,400	421,000
Value per ton.....	\$18.38	\$17.64	\$16.55	\$14.44
Total value	\$3,169,600	\$3,353,400	\$3,499,000	\$6,080,000

Development is by a 500' inclined shaft and several tunnels, with about 25,000' of workings. Equipment includes a steam plant, with hoist and an air compressor.

The 40-ton mill at Sotario treated 32,793 tons of \$9.86 ore in 1910 and 70,229 tons of \$7.85 ore in 1911. In 1912 the mill handled 74,432 tons of \$8.25 ore at a cost of \$3.52 per ton with an extraction of 86.20% of the gold and 20.34% of the copper, or a total profit of \$4.73 per ton.

Production for 1912 was about 2,235,000 lbs. fine copper.

SERENA; SOCIEDAD MINERA DE LA.

CHILE

Mine office: Higuera, La Serena, Coquimbo, Chile. Lands include the Llanca and Llanquita mines, in the vicinity of the Mina Cocinera, having a vein of about 3' width, with E.-W. strike, opened to depth of 240 meters, and for length of about 400 meters. Equipment includes a 40-h. p. steam plant.

SEVILLE SULPHUR & COPPER CO., LTD.

SPAIN

Office: 30 George Square, Glasgow, Scotland. Operating office: Patio

de Banderas, Sevilla, Spain. Mine office: Aznalcóllar, Sevilla, Spain. Jas. Pipe, chairman; Arthur Henderson, A. N. Henderson and C. H. Graham, directors; John Munro, sec.; John S. Macdougall, gen. mgr. Robt. Andrew, mine mgr. in Spain. Organized Aug., 1877, under laws of Great Britain, capitalization £120,000, shares £10 par, fully issued. Is a close corporation, and publishes no accounts.

Property, at the eastern end of the Sierra Morena, in the province of Sevilla, carries pyrite with good values in copper and silver. The mine has been worked for many years by the present company, and is supposed to have returned good profits. Production was 2,867,200 lbs. fine copper in 1905; 4,569,600 lbs. in 1906; 4,152,000 lbs. in 1907; 4,838,400 lbs. in 1908; 4,076,800 lbs. in 1909; 3,651,200 lbs. in 1910; 3,427,200 lbs. in 1911; 3,113,600 lbs. in 1912.

SEYMOUR COPPER MINING CO., LTD.

ENGLAND

Office: 41 John Dalton St., Manchester, Eng. No trace of operations securable.

SHIRVAN MINING CO., LTD.

SCOTLAND

Office: 149 West George St., Glasgow, Scotland. R. C. G. Campbell, W. Kidston, H. Macdowall, J. S. A. Taylor and J. Kenneth, directors, at last accounts. Organized, Dec., 1910, capitalization £20,000, shares £1 par.

Company owns mining rights in Argyllshire, Scotland.

SIBERIAN COPPER CO.

SIBERIA

Mine office: Abakanski, Yenisei, Siberia. Acquired property of Yenisei Copper Co., 1911, for 375,000 rubles cash and 500,000 rubles in shares. Lands, 3 concessions, presumably 3,000 acres, include the Julia mine, an old property, in the district of Minoussinsk.

The Julia mine, opened by 5 shafts, deepest 250', shows highly silicious ore, averaging about 3% copper.

The smelter, one-fourth mile from the mine, has a 36x120" water-jacket blast furnace, which treats 60 to 75 tons daily, burning charcoal. The product is 40% copper matte, which is broken in rolls, roasted and then smelted with 3% fuel charges, in shaft ovens, to black copper of 88% copper tenor. This is shipped to Swansea for refining to a final product of 99.75% copper tenor.

SIBERIAN SYNDICATE, LTD.

SIBERIA

Secretary and office: J. A. Clark, 60 London Wall, London, E. C., Eng. A. Fell, chairman; A. Davidson, F. H. Hamilton, L. Ehrlich, H. A. Scott and E. T. McCarthy, directors; Charles A. Vaux, mgr., in Siberia. Organized June 3, 1902, reorganized Nov. 12, 1903, and again reorganized June 16, 1905, capitalization £100,000, shares £1 par; issued 52,055 shares, fully paid.

Company is a securities-holding corporation, with large share holding in the Atbasar Copper Fields, Ltd., and in other interests owning mining properties in the Lake Baikal district, in Siberia.

SIEMENS COPPER WORKS.

RUSSIA

Address: Kedabeg, P. O. Annenfeld, Government Elisabethpol, Caucasus, Russia. Gustav Koelle, first director, Hirschsprung 3, Berlin-Dahlen, Germany; A. Oehrn, second director, Kedabeg, Russia.

The Kedabeg (Kiadebek, or Kedabenski) mine is an old property covering 3 sq. kilometers, reopened by Siemen Bros. in 1864 and now practically exhausted. It is located on the side of the Miodagh, or Copper mountain, 29 miles S. of Dalliar, on the Trans-Caucasian railroad.

The copper deposits occur as lenticular orebodies enclosed in a mass of altered quartz porphyry that is over one-half mile long and one-fourth mile wide, lying between diorite and younger diabase porphyry. Kedabegite, a basic garnet-pyroxene rock, occurs near and is genetically con-

nected with the ore. The orebodies rest on the quartz porphyry and that rock is cut and partly covered by diabase porphyry. The ore lenses vary from 6 to 165' thick, 16½ to 165' in width and 33 to 820' in length. Sixteen of them have been found. The ore consists of pyrite, pyrrhotite, chalcopryite and covellite with accessory zinc blende. These minerals occur mixed with rock, often as small veins of pyrite shading into the country rock. Partings are entirely lacking. Ore varies from 1 to 7% copper.

Ore extraction has been by tunnels and mining done by the caving-in and by the pillar-and-stall methods. The output is sorted at the surface into 3 grades, viz.: smelting ore with 5% copper; leaching ore with 2% copper, and pyritic or sulphur ore, sold to the Baku oil refineries for sulphuric acid manufacture.

Ore carrying less than 4% copper is heap-roasted down to 8 to 10% sulphur content, formed into great heaps and exposed to the air and rain, the resulting copper sulphate solution being precipitated with iron shavings.

The smelting ore has been treated at the Kedabeg reduction works, about a mile from the mine, the plant treating about 160 tons per day. The plant has a 35-ton water-jacket blast furnace, installed 1912, and five 30-ton reverberatory furnaces receiving roasted ore from kilns and Gerstenhofer calciners. A matte carrying 30 to 40% copper is produced and this is reduced to black copper of 90% tenor carrying 0.08 to 0.1% silver and 0.004 to 0.006% gold per ton. The works, though old-fashioned, have done splendid service under their efficient director. The supply of smelting ore being exhausted, the property will hereafter produce only low-grade leaching ore and its copper production after 1913 is estimated at 500 tons, or 1,100,500, lbs. The change from shaft furnaces to the water-jacket blast furnace was due to the greatly increased price of naphtha; for the same reason, steam power has now been replaced by a 125-h. p. Diesel oil engine.

Production has averaged about 3,500,000 lbs. copper annually, since 1900. Production for 1912 was 15,333 tons of smelting ore carrying 4.8% copper and 33,000 tons of 1.5% ore, treated by leaching. The average cost of mining is given at \$5.50 per ton and of smelting of \$7.50 per ton, the finished copper costing 13.21 cts. per lb.

The Siemens estate is now developing the Kwarzchana mine on the Tschoroch river, about 40 miles S. of Batum, in the Caucasus. This property is said to have 50,000 tons of commercial ore proven as the result of exploratory work continued since 1902. A modern smelter is now in course of erection and will be in operation by March, 1914.

SIERRA CO., LTD.

SPAIN

Office: 32 Nicholas Lane, London, E. C., Eng. Mine office: 10 Plaza del General Santacildes, Burgos, Burgos, Spain. W. R. Smith, secretary. Organized April 2, 1898, under laws of Great Britain, capitalization £400,000, shares £10 par; debentures £482,600 outstanding, at 5%. The company also holds a railway concession. Company is reported to own various pyritic deposits in the provinces of Burgos and Logroño, Spain, as well as various iron, copper, silver and coal mines. Idle.

SIERRA MORENA COPPER MINES, LTD.

SPAIN

Office: 18 Ropemaker St., London, E. C., Eng. Mine near Peñafior, Spain. Arthur S. Plews, chairman; S. R. Adcock and H. O'Reilly, directors; E. T. Evans, sec. Organized April 17, 1900, capitalization £110,000, shares £1 par; issued £80,560. Lands, 215 acres, include La Preciosa and adjoining mines, claimed by the company to have developed ore reserves of 100,000 long tons. No returns secured for 1912.

SILVER SPUR MINING CO., N. L.

QUEENSLAND

Office and mine: Silver Spur, Queensland, Aus. Robt. Thos. Vyner,

chairman; Edgar Hall, sec. and gen. mgr; G. W. Dight, Dr. Watt and R. H. Bulkeley, directors. Henry Wann, mine supt. Organized 1897, in Queensland, capitalization £24,000, shares £1 par; fully issued, 15s. paid. Paid cash dividends of £22,900, and stock dividends of £3,140 in shares of other companies, to Dec. 31, 1912. Annual meeting, in March.

Lands, 49 claims, leasehold, and a 3-acre mill site, in the Stanthorpe district 47 miles from the Queensland Government railway. The property shows Gympie beds, with slate and Carboniferous limestone, having 4 fissure veins in slate, carrying lenticular orebodies of 1 to 30' width, the main orebody being 30' wide on the 300' level. The ore is a complex of copper, lead and zinc sulphides, averaging about 1.25% copper, 12% lead, 15% zinc, 26 oz. silver and 2s. gold per ton, with values mainly in silver,

The mine, discovered 1891, opened 1892, and since worked continuously, has shafts of 180', 520', 80' and 80', with bottom level at 500'. The company also controls a coal mine and coking plant, near Ashford, N. S. W. With the advent of railway transportation in 1914, the lead and zinc ores of the mine can be made to yield a return.

Equipment includes a 350-h. p. steam plant, with a hoist and a 5-drill straight-line air compressor. Fuel is coke and wood, latter costing 12s. per cord. The company also has a sawmill and a brickyard.

The reduction plant, rebuilt 1908, includes a concentrator and smelter, the former, receiving ore by tram line from the mine, having a Krupp ball mill, replacing a Chilean mill, and 2 jigs.

The 35-ton smelter has a Ropp calciner, a 100-ton 42x100" water-jacket blast furnace, and a 40-ton reverberatory furnace, with crane for handling slags. Product is a matte averaging about 35% copper, 600 oz. silver and 4 oz. gold per ton, sent to Europe for reduction. Bauxite bricks are used for lining the firebox of the reverberatory, and fuel is wood.

Production to end of 1912 was 1,021 long tons of copper, 1,361 tons lead, 1,898,536 oz. silver and 4,430 oz. gold.

SISSERT COMPANY, LTD.

RUSSIA

Office: Pinners Hall, Old Broad St., London, E. C., Eng. Sir J. B. Dale, Bart., chairman; W. Selkirk, A. C. G. Egerton and Ralph Peto, directors, in London; Prince A. D. Golitzin, Prince A. P. Ourousoff, G. Beneson and F. Landsberger, directors, in Russia. A. L. Simon, cons. engr.; N. C. Stines, resident engr.

Organized June 26, 1912, capitalization £1,000,000, shares £1 par; issued 755,000 shares, fully paid. Paid a dividend of 5% in 1913. Shares are listed on the London Stock Exchange. The Russian Trust & Finance Co., Ltd., holds an option expiring June 30, 1914, on 173,000 shares treasury stock. Title to property is held through the Sissert Mining District Co., Ltd., registered in Russia, which the company controls through ownership of entire share capital.

Lands, about 340,000 acres, held under a perpetual lease, in the Urals, 30 miles S. of Ekaterinburg, on the Perm-Cheliabinsk railway. The property includes many old copper, gold and iron mines and extensive forests, the principal copper properties being the Poleskoy and Gumeshevsky mines, which have been worked since 1727, and the Sysselsky, opened in 1906. There are also about 40 iron mines, yielding limonite ore of 40 to 53% iron content, with other mines yielding chrome and manganese. Iron ore reserves are estimated at 6,000,000 tons. Gold mining is confined to the alluvial deposits near the village of Sissert, where there is also a small quartz mine.

The Sysselsky copper mine is opened by 3 shafts, deepest 245', showing ore of about 5% copper tenor. Mine has a plant with a productive capacity

of 1,500 tons per annum, making its copper at a cost of about 10 cts. per lb. Ore reserves are estimated at 55,500 tons, with additional "probable ore" of about 150,000 tons.

The Gumeshevsky and Polefskoy mines, discovered in 1716, have been operated almost continuously since 1727. These mines are about 500' deep, and up to 1870 produced a total of about 63,500,000 lbs. fine copper, though only oxidized ore was mined. The orebody is a contact deposit, genetically related to augitic rocks, and lying between limestone and augitic biotite syenites, the oxidized ore occurring in a decomposed irony and calcareous clay belt, fully 2 miles in length and about 1,000' wide. The sulphide ores carry chalcopryrite in lenses of garnet-magnetite rock. The old ore dumps at the Gumeshevsky, consisting of clay material with fine ore that escaped hand-picking in earlier operations, are now being worked with excellent results. The dumps cover about 20 acres, and probably contain 550,000 cu. yds. of material averaging 23 lbs. copper per yard, much of which is recoverable by leaching, a trial run made on 38,000 cu. yds in 1908 yielding 175 tons copper, or about 10 lbs. copper per cu. yd. Old slag dumps at Polefskoy are also to be reworked. These dumps, estimated at 640,000 tons, are said to contain 1% copper, about 75% of which is thought to be recoverable by pyritic smelting.

Production 1912, was 3,339,840 lbs. copper, 6,467 oz. gold and 1,377 oz. platinum.

SJANGELI MINES.

NORWAY & SWEDEN

Office: Stockholm, Sweden. Mine office: Sjangeli, Nordland, Tromsø, Norway. Lands, 30 miles from the coast, include the Sjangeli, Alakats, Valfojokk and Ruopsuokjaure groups, partly in Tromsø, Norway, but mainly in Swedish Lapland. The property shows hornblendic schists, with thin beds of limestone and lenticular bodies of massive gabbro, ore containing cuprite, chalcocite, bornite and chalcopryrite, disseminated in a foliated schist. This ore is said to contain 2.5 to 55% copper, and to average 12.5%, which is much too high. Presumably idle.

SNELSTON COPPER MINE, LTD.

ENGLAND

Secretary and office: T. Allen, Snelston Copper Mine, Snelston, Derbyshire, Eng. E. M. Fox is permanent chairman and governing director, as long as he continues to hold one-sixth of the issued capital. Organized March 3, 1910, under laws of Great Britain, with capitalization £10,000, shares £1 par. Owns mining rights to lands at Snelston and Norbury, in Derbyshire, for which Mr. Fox received £1,500 in fully paid shares. No trace of operations secured.

SNOWBALL COPPER MINING CO., N. L.

NEW SOUTH WALES

Mine office: Gundagai, Wynward Co., N. S. W., Aus. Organized March 18, 1907. Lands, 38 claims, leasehold, on Snowball hill, 3 miles from Mt. Horeb railway station and 9 miles from Gundagai at the head of Snowball creek, a tributary of the Murrumbidgee river. The mine, discovered 1873, was worked vigorously from 1876 until 1880, when smelting was abandoned. The mine has a vein of 2 to 4' width, carrying chalcopryrite, opened by a 210' shaft, sunk by the old company, with bottom level at 175', and with laterals of about 300' length. The present company sunk a 25' shaft. Idle several years.

SOCIÉTÉ FRANÇAISE DES MINES DE CUIVRE.

CHILE

Office: 43 Boulevard Hausmann, Paris, France. Operating office: Iquique, Chile. Mine office: Collahuasi, Tarapaca, Chile. Company originally organized 1889, as Cia. Minera de Collahuasi, changed name to present title 1912. Capitalization 15,000,000 francs.

Lands, 251 claims, 1,211 hectares, principally on Collahuasi hill, near

the peak of that name, at an elevation of 4,480 meters above sea level. Lands include various mines, deepest workings being 500', carrying fissure veins in porphyry having an oxidized zone of about 100 meters depth, which shows argentiferous copper ore averaging nearly 20% in tenor, succeeded by chalcopyrite.

Principal property is the Pergolesi mine, having 8 levels opened on the Pergolesi and Delirio veins, showing ore of high average tenor. The Don Eduardo mine has a 36' orebody, claimed to average 30% copper on the 3rd level, a statement vouched for by authorities of excellent standing. On the 2nd level N. the Don Eduardo has various veins of 3 to 4' thickness, giving average assays of 66% copper, presumably from massive chalcocite. The San Nicolás mine has 2 levels opened, showing ores averaging 20% copper, with rich bunches up to 50% in tenor, in a vein of 16" to 8' width. The Anita mine shows ore up to 50% copper tenor in rich shoots, with long stretches of barren ground intervening. The Tiuque mine shows various small stringers of ore and has a vertical shaft, which will cut the Tiuque vein at a depth of about 45 meters. The Esperanza mine has the Empalme shaft of 3x5 meters section, and plans sinking a new shaft 250 meters to the S. The Sud-America mine has a 42' main shaft, showing a little ore.

The mines as a whole are said to have fully 250,000 tons of ore blocked out, averaging 9% copper, 12 oz. silver and 8 grams gold, with additional reserves, in backs and pillars, amounting to 100,000 tons of 20 to 25% copper ore. Production is around 1,800 tons of ore per month.

Transportation is by llamas to Carcote, but a number of aerial tramways are planned to connect the mines with the Ollague i Collahuasi railway. The property is one of exceptional promise, if given competent management and ample financial backing.

SOCIÉTÉ DU SYNDICAT MINIER. ALGERIA

Office: 60 Rue St. Lazare, Paris, France. Mine office: La Calle, Algeria. M. Charret de la Fremoire, chairman. Organized May 3, 1906, under laws of France, capitalization f2,500,000, increased 1907, to f6,000,000, and again increased 1907, to f10,000,000, shares f100 par. Property includes the Kef-oum-Theboul copper mine in Algeria, zinc properties at Santander, Spain, and several zinc mines in France. The Kef-oum-Theboul mine, 11 kilometers S. E. of La Calle, first opened 1848, has a strong vein traversing schists and limestone and carrying cupriferous pyrite, argentiferous galena and sphalerite in ores with schistose gangue. This ore, after selection, assays 2.5 to 14% copper and 14 to 53 oz. silver per metric ton.

SOUTH AFRICAN COPPER TRUST, LTD.

RHODESIA & PORTUGUESE EAST AFRICA

Secretary and office: E. J. Sloan, 277 Salisbury House, London, E. C., Eng. Operating office: Bulawayo, Rhodesia. R. Simpson, chairman; J. F. Walker and C. A. Dodds, directors. Organized Sept. 23, 1910, under laws of Great Britain, as a reconstruction of the Consolidated African Copper Trust, Ltd., which went into liquidation Oct. 4, 1910, capitalization £375,000, shares 5s. par; issued 1,048,735 shares, fully paid. Stockholders of the old company took 558,000 shares, of 5s. par, in exchange for a similar number of £1 shares. Apparently the London & Johannesburg Trust guaranteed 75% of the new capital, to acquire control.

Lands are very extensive, including producing mines in the Manicaland of the Mozambique Co.'s territory, Portuguese E. Africa, and large tracts in Rhodesia. Property includes 236 claims in the Lomagunda district; 930 in the Victoria district; 20 in the Umtali district; 70 in the Tuli district; 380 claims and a 20% interest in 190 claims additional, in the Kafue district; 23 claims in the Gwelo district; 60 in the Bechuanaland protectorate; 2 farms, of 1,500 morgen each, in the Lomagunda district; 2 coal areas in the Victoria district, and the right to locate 430 claims N. of the Zambesi river. The company also owns a half interest in a syndicate holding copper claims in Namaqualand, Cape Province, and a share interest in the North Zambesia Coal Syndicate, Ltd.

The Alaska mine, 90 miles N. W. of Salisbury, in the Lomagunda district, shows the largest ancient workings in Rhodesia, these having an extreme width of 600', and extending for about 1,700' in length, with an extreme depth of 70'. The orebodies are estimated at 150' width and 1,700' length, which estimate seems high. Diamond-drill borings have shown copper ore to depths of 200 to 800', and the company estimates that 300,000 tons of cupriferous schists of 3% copper tenor are exposed above the water level. Ore minerals are mainly malachite, disseminated through silicious and calcareous schists. The Alaska mine has been idle some years.

The Umkondo mine, 10 miles W. of the Subeni river, and about 115 miles E. of Victoria by wagon road, shows remains of ancient workings inferior only to those of the Alaska mine, extending for a length of about 1,500', and with an extreme width of 300', and there are some open pits of 60' depth, with occasional shallow shafts, from which ore has been stoped to the water-level. The copper occurs mainly in the form of malachite and azurite, as seams and incrustations in sedimentary shales and sandstones, overlying an older granite, apparently unconformable, and intersected by numerous dolerite dikes, the copper apparently having been introduced into these beds along zones of fracture. The Umkondo has been tested extensively by diamond drilling, cores giving average assays of 9% copper, and several shafts have been sunk showing 2 veins, with a shallow oxidized zone. Considerable new development work has been done at the Umkondo, and the management estimates the prospective tonnage at 91,285 long tons of 8% copper ore.

The Edmundian mine is near Macequece, Manicaland, in Portuguese E. Africa. The mine is near the Rhodesian border, 3 miles from a railway, and is opened by shafts to the 7th level. Ore occurs in a fissure vein in talcose schist, varying in width, but with fairly regular contents ranging from 5 to 15%, with an average return from ore actually mined of nearly 10% copper and carrying up to 3 dwts. gold per long ton. Ore is oxidized near surface, but mainly chalcopryite at depth, and is exceedingly friable.

A hydro-electric plant, on a river 6 miles distant, transmits current at 6,600 volts, stepped down for use at the mine.

At the mill, ore is hand-picked on belts, rich ore and barren rock being removed, ore discharged from end of belt averaging 4 to 5% copper, this ore being sent to a Robey crusher and 3 Holman pneumatic stamps, latter crushing ore to pass 300 mesh. The Holman air-cushion stamps have a rated daily capacity of 20 to 25 tons each, and were giving only about half duty at last accounts. Fine ore from the stamps goes to an Elmore oil concentration plant, yielding concentrates of 20 to 22% copper tenor, with tailings of about 1%.

The smelter, about a mile from the mine, blown in Oct., 1908, is connected with the mine by a 1-mile Ropeways aerial tram, which crosses a spur of the Sierra Isataca, over a precipice, with a difference of about 1,000'

in altitude. Elmore concentrates are calcined and sent to the reverberatory furnace, which makes matte, or pimple metal, that averaged 84.03% copper in 1908. The matte is crushed in small pieces, packed and shipped to England for sale. A blast furnace, built 1910, is planned to try semi-pyritic smelting, and also to treat the coarser ores, and slags from the reverberatory. The mill and smelter have not given entire satisfaction but it is hoped that they may be keyed up to do better later. The mine apparently is not large, but has fair sized bodies of ore, of excellent average grade.

Production secured entirely from the Umkondo and Edmundian mines, was valued at £22,000 in 1909, and £20,585 in 1910. Developing at present.

SOUTH AFRICAN TERRITORIES, LTD. GERMAN S. W. AFRICA

Secretary's address: C. C. Willson, Finsbury Pavement House, London, E. C., Eng. D. N. Shaw, chairman, E. Braetsch, A. L. Horner, Maj. V. Paget, K. Schmidt and E. Martin, directors. A. P. Scotland, Keetmanshoop, German S. W. Africa, gen. mgr. Organized Sept. 11, 1895, and reconstructed June, 1900, capitalization £500,000, shares £1 par; issued 482,328 shares, fully paid.

Lands, about 30,000 sq. miles, held under concession from the German Government, including farm lands aggregating 2,700,000 acres and mineral claims of 10,496 acres, at Aiais and Klein Kharas, in the Bondelswarts, Zwartmodder and Veldschoendrager territories. Farm lands are sold and leased. The mineral lands show copper, galena, wolfram and mica, and coal beds have also been located by drill borings near Auros, about 8 miles from Keetmanshoop.

The company is not directly engaged in mining, preferring to operate through subsidiary companies.

SOUTH AMERICAN COPPER SYNDICATE. VENEZUELA

Office: 2 Broad Street Place, London, E. C., Eng. Mine office: Aroa, Lara, Venezuela. E. Edwards, chairman; Chas. D. Comrie, sec.; W. J. C. Scrutton, mine mgr. Organized March 27, 1907, under laws of Great Britain, capitalization £7,500, shares £1 par, increased 1908, to £15,000 shares 2s. par; 98,905 shares fully paid and 51,095 issued as part paid. Dividends for fiscal years ended June 30 were 25% in 1909, 30% in 1910, 145% in 1911, and 250% in 1912.

Lands, 25,000 acres, freehold, 67 miles W. of Puerto Caballo, known as the Aroa or Quebrada mines, have produced about 60,000 tons fine copper, and were operated extensively, 1881-94, by the Quebrada Land & Copper Co., yielding 271,770 long tons of copper ore, valued at about £1,250,000. Property includes the Titiara mine, having a vein of 2 to 25' width, the San Antonio mine with a vein of 3 to 18' width, and the Aroa mine, having a vein of 50 to 75' width, of 2,000' known length, and of unknown depth, from which the oxidized ores have been mined, leaving a large body of sulphide ore in the lower workings. Only ore averaging better than 8% copper is shipped to Europe for reduction. A smelter, to treat the lower grade ores, is in the course of erection.

SOUTH URALS MINING, MILLING & SMELTING CO. RUSSIA

Is controlled by the Tanalyk Corporation, Ltd., and property described under that title.

SOUTHWEST AFRICA CO., LTD. GERMAN S. W. AFRICA

Secretary and offices: C. Launspach, 1 London Wall Bldg., London, E. C., Eng., and Unter den Linden 35, Berlin, Germany. E. Davis, chairman, C. E. Atkinson, M. von Brandt, G. Cawston, Dr. P. D. Fischer, J. B. Schroeder, F. G. J. Eckstein, Paul Mankiewitz and E. Woermann, directors; Ole Falk Moe, at Grootfontein, African mgr. Organized Aug. 18, 1892, capitalization £300,000, increased successively to £400,000, £500,000,

£1,000,000, and finally, in 1902, to £2,000,000, shares £1 par; issued £1,750,000. Dividends were 5% in 1908, 7½% in 1909, 5% in 1910, 7½% in 1911, 5% in 1912. Accounts to Dec. 31, 1912, showed profits of £81,908, and cash balance of £135,418, out of which the 1912 dividend, amounting to £87,500 had to be paid, April, 1913.

Property comprises about 20,000 sq. miles, in which company has mining rights and 3,500 sq. miles of freehold land, in Damaraland; a one-half interest in mining rights to 23,000 sq. miles, in Ovamboland; a large share interest in the Kaoko Land & Mining Co., owning 37,000 sq. miles freehold land; a two-thirds interest in the South African Co., Ltd., owning about 66,000 sq. miles of mining rights, in Angola, Portuguese S. W. Africa, nearly one-half interest in the Hanseatics Mining Co., owning mining rights covering about 15,000 sq. miles; a large share interest in the Otavi Mines & Railway Co., small interests in the Southwest African Mining Syndicate, the Otavi Exploring Syndicate, Ltd., and the Angola Exploring Syndicate, Ltd., and about £1,800,000 in cash, farm mortgages, and choice securities.

SPANISH COPPER CO., LTD.

SPAIN

Office: 2 Tokenhouse Bldgs., London, E. C., Eng. F. T. Fisher, chairman; Miguel Yglesias, managing director. Organized June 8, 1883, capitalization £150,000, shares £1 par; issued £110,000, fully paid. Property was sold, 1907, to the Anglo-Spanish Copper Co., Ltd., and property of this company consists of shares in the Anglo-Spanish Copper Co., Ltd., and rights to shares in the Romanera Copper Co., Ltd., which companies are in litigation with each other, and early 1913, were preparing to transfer the property to the Soc. de Saint Gobain Channy et Arey (which see).

SPASSKY COPPER MINE, LTD.

SIBERIA

Secretary and office: J. A. Clark, 60 London Wall., London, E. C., Eng. Mine office: Spassky Zavod, Akmolinsk, Siberia. Arthur Fell, M. P., chairman; Ernest Carnot, vice-chairman; F. H. Hamilton, Jean B. Depelley, E. W. Parker and F. Robellaz, directors; H. C. Wolmer, gen. mgr.; E. C. Vigeon, resident mgr.; C. Farmer, mine supt.; R. M. Percy, coal mine supt.; E. T. McCarthy, cons. engr.

Organized July 9, 1904, in Great Britain, capitalization £300,000, shares £1 par, increased March, 1908, to £500,000 and May, 1911, to £600,000, with a further increase to £1,250,000, authorized, 1913, for the purpose of acquiring the property of the Atbasar Copper Fields, Ltd., on the basis of 2 Atbasar shares for 1 Spassky share, and giving to shareholders the opportunity to acquire, at par, 1 new share for every 3 shares held. The consummation of these plans will result in an issued capital of £989,815. A former debenture issue of £242,650 has been entirely converted on the basis of 1 share of stock for each £3 debenture held, or repaid in cash at 105%. Dividends, paid semi-annually, were 15% in 1910, 17½% in 1911, and 25% in 1912. The report for the fiscal year ended Sept. 30, 1912, showed net profits of £174,796, compared with £87,911 in 1911, £68,409 in 1910, and £9,552 in 1909. The net cost per long ton of fine copper secured during first 6 months in 1913, is reported to have been £28 9s. 4d., or about 6.17 cts. per lb. of fine copper.

Lands, in the Kirghiz Steppes, in 2 main groups, about 300 miles apart, and 200 miles and 500 miles from the nearest point on the Trans-Siberian railway.

The Spassky group, comprising about 100 sq. miles, in the Akmolinsk district, includes the Yuspensski copper mine, and the Karagandy and Saran coal mines; also lands carrying iron and limestone.

The Yuspensski mine has a network of veins, at and near the contact of slate and arcose sandstone, in sedimentaries of Permian age. The 2 main

veins, known as the Annenski and Vladimir, or Yuspensski, are about 200' apart and substantially parallel, and it is thought they may join at depth. Principal development is on the Annenski vein, which is 10 to 60' in width, carrying a hanging-wall paystreak of massive chalcocite, succeeded by bornite, largely massive, with silicious gangue, followed by small quantities of chalcopyrite and occasional tetrahedrite, the vein growing gradually leaner in copper toward the footwall, which is imperfectly defined and carries low-grade copper impregnations. The gangue is mainly quartz and barite, and the ore is estimated by the company to average 12 to 20% copper. The upper workings show some native copper, cuprite, azurite and malachite. The mine was gouged for rich ore by the former owners, who left a large amount of low-grade material unstopped. The mine has been tested by diamond-drill borings to a depth of only 475', ore in the bottom of the holes assaying up to 67% copper, but further prospecting is planned.

The mining practice of the former owners was of the most primitive nature, with timbering costs averaging \$1.25 per ton of ore mined, and the timbering was subject to frequent crushes, owing to bad mining, after which new timbers were installed inside of the old, with the result of eventually reducing the mine openings to impassable dimensions.

The new development by the present company includes 6 shafts, of 120 to 560' depth. The 560' Annenski main shaft is sunk in the foot and connected with the vein by crosscuts. The 420' level shows a vein of about 30' average width, carrying ore of 10 to 40% copper tenor, with an average, from smelting returns of 20%. There are 3 shafts each on the Annenski and Yuspensski veins, and the Annenski vein was claimed to show, in a crosscut on the 300' level, in addition to the main vein above referred to, 651' width of vein matter, carrying gradually declining copper values, the crosscut ending in material of about 1% copper tenor, only, hence it is thought that the vein may prove materially wider than heretofore worked.

The 490' level of the Annenski shaft shows ore of 14 to 18% copper tenor, and the mine was estimated, 1912, to have developed about 100,000 long tons of ore, of 17½% average copper tenor.

Equipment at the mine includes a 700-h. p. steam plant, with a 50-h. p. hoist, good for 1,000' depth, and a 10-drill straight-line air compressor. There is a small test mill, with crushing and Elmore vacuum oil flotation plants. Buildings include a machine shop and smithy, with numerous dwellings for workmen, forming a small town, in which the company maintains schools, baths, a hospital and church.

The Karagandy coal mine, 24 miles N. W. of the smelter, has 2 seams of 60" and 65" thickness, and is said to yield about 60,000 long tons of coal yearly, supplying the company's requirements, in addition to furnishing a considerable production for sale. The mine is said to be producing coal for 6s. per long ton, at the pit's mouth.

The company has a 26-mile private railway, known as the Spassky-Karagandy line, of 600-mm. gauge, equipped with 5 locomotives and 75 cars, connecting the smelter and coal mine. The copper mine is about 500 miles from the nearest point on the Trans-Siberian railway, and transportation is by camels in winter and horses in summer, with an average freight charge of about £3 per ton. The smelter is 74 miles N. E. of the mine, and under the old management ore was carried in carts, but so much ore was lost in transit that the line became emblazoned by a purple train of bornite, visible for several miles. The Russian Government is said to have been considering, for several years, an extension of the Orenburg-Akmolinsk-Semipalatinsk railway to pass near the Spassky property.

The old smelting plant, which was poorly designed, has been patched

up and improved, but remains far from modern. The capacity is reported by the management as 80 to 100 tons daily. Equipment includes 4 blast furnaces, the works being designed for a capacity of 400 long tons fine copper monthly. The converter department has a 20-ton electric traveling crane and 2 stands, with shells of the Anaconda type, treating matte of 58% copper tenor and turning out blister copper averaging 99% copper. There is an electrically-driven quartz mill for pugging converter linings.

The smelter power plant has a 700-h. p. steam installation, 150-h. p. electric plant and a 150-h. p. air plant having 2 Roots' blowers and a Bessemer blowing engine.

A complete geological survey and report on the property was made, 1911, by Dr. James Mackintosh Bell.

The Athasar group, 28½ sq. miles, 250 miles N. E. of Djousalie, the nearest station on the Orenburg-Tashkent railway, includes the Kresto, Pokrofsky, Annenski and Nadiozhdenski mines, and a coal area of about 9 sq. miles, 65 miles from the mines.

The Athasar shows sedimentary sandstones, shales and conglomerates, on a plateau of about 20 square miles, lying about 70' above the level of the district, carrying numerous outcrops of malachite, and at depths of 50 to 70' from surface, are found sandstone beds mainly 18" to 8' thick and of 3' estimated average thickness, carrying bornite, claimed to average about 13% copper. Property shows a number of old pits of 30 to 50' depth in an area of about 30 acres, where oxidized ores were mined in the past. Eight different beds up to 25' in thickness are being developed, showing malachite to depth of 30 to 50' from surface, succeeded by bornite, chalcocite and a little chalcopyrite. Development is by 8 shafts of 40 to 150' depth. The mine has about 3,000' of workings. Management estimates that diamond-drill borings show about 625,323 tons of ore developed, estimated to average 10.2% copper. Diamond-drill boreholes have shown ore assaying 2 to 35% copper. The company claims an orebody 7 miles long and 1½ miles wide, with a secondary orebody of about 3 miles length and 1 mile width.

Equipment includes steam boilers and hoists of small capacity at the various shafts. Company has about 30 buildings, the main camp at the Pokrofsky mine including an office, laboratory, smithy, machine shop, stables and dwellings. The old office at the Kresto mine has been made a hospital. Fuel is balesh, or small bushes, and coal from the company's mines, latter estimated to cost, delivered, about 25s. per ton. Company plans further extensive development, with preliminary smelting tests, and survey for a 60-mile railway between the coal and copper mines, and early 1913, began the erection of a smelter of 100 tons daily capacity.

Production at Spassky has been as follows: 1906, 1,865,690 lbs. copper; 1907, 3,552,570 lbs.; 1908, 3,838,235 lbs.; 1909, 3,675,840 lbs.; 1910, 5,540,160 lbs.; 1911, 6,401,920 lbs.; 1912, 8,955,520 lbs.; 1913 (6 mos.), 5,877,760 lbs.

SPRING CREEK MINING CO., N. L.

SOUTH AUSTRALIA

Office: Wilmington, Frome Co., South Australia. C. J. Tuckwell, chairman; E. P. Dignan and Mark Gray, directors.

Lands, 1 claim, 32 acres, on Spring creek, 8 miles S. of Wilmington, on the northern flank of Mount Remarkable. The country rock is clay-slate and sandstone. Ores are cuprite, azurite, malachite and tetrahedrite, associated with iron, said to carry from 4 to 8% copper. Development is by a 140' shaft and a tunnel. Inactive.

SQUIRREL VALLEY COPPER MINE, LTD.

NORWAY

Office: 80 Coleman St., London, E. C., Eng. Mine office: Risør, Christiansand, Norway. W. W. Macalister, D. A. Onslow and J. H. Hosking, directors. Organized Oct. 28, 1909, under laws of Great Britain, capitaliza-

tion £35,000, shares £1 par. Property is the Ekorndalen mine, near Risör. No returns.

STADTBERGER HÜTTE AKTIENGESSELLSCHAFT.

GERMANY

Office: Postscheckkonto No. 1450, Köln, Germany. Mine office: Nieder Marsberg, Westfalen, Germany. Otto Meurer, chairman; Anton Hamers, vice-chairman; other directors, C. Hupertz and G. Bunge; Erich Meurer, mgr. Organized 1873, under laws of Germany, capitalization 2,250,000 marks, shares 600 marks par, as a reconstruction of the Stadtberger Gewerkschaft, which began operations A. D. 1150. Paid dividends of 112,500 marks to Dec. 31, 1907, with dividends of 2% in 1908, nothing in 1909, 1% in 1910, 1% in 1911, and 4% in 1912.

The mine is very ancient, having been discovered about A. D. 800, and has been worked, with few idle intervals, since A. D. 1150. The property includes the Friederika, Mina and Oscar mines, the 2 latter opened by new shafts. Ores carry malachite, chalcocite and bornite, estimated by the management to average about 1.6% copper.

Equipment includes a 400-h. p. steam plant, and a 60-h. p. water plant, developing electric power.

The reduction works include a crusher, smelter and 1-ton electrolytic refinery, latter treating argenteriferous copper precipitate, as ore is reduced mainly by leaching. Forces average about 400 men, with a yearly production of about 40,000 metric tons of ore. Production was 1,609,358 lbs. fine copper in 1905, 1,388,898 lbs. in 1906, 1,322,760 lbs. in 1907, 1,432,990 lbs. in 1909, 1,458,087 lbs. in 1910, 1,528,705 lbs. in 1911, 1,658,278 lbs. in 1912.

STRICKLAND MINE.

TASMANIA

Mine address: Temma, Tasmania. J. Shortall, owner. Property, near a seaport, shows a good vein of cupriferous hematite, carrying up to 23% copper after sorting.

SUBENI MINE.

NATAL

Mine address: Goudhoek, via Vryheid, Zululand, Natal. The property, on the Subeni river, 42 miles S. of Vryheid, shows granite, with bodies of schist carrying 2 veins of 4 to 8' width, developed to a depth of about 150' by shafts and tunnels. Ore, after sorting, was reported to have yielded 30% copper. Idle several years.

SULITELMA AKTIEBOLAG.

NORWAY

Office: Helsingborg, Malmöhus Län, Sweden. Mine office: Sulitjelma, Nordland, Norway. Lord-Lieut. G. Tornerhjelm, pres. and first managing director; Consul Nils Persson, vice-pres. and second managing director; Consul C. Ingelsson, sec. and asst. managing director; Holm Holmsen, gen. mgr.; preceding officers, Hon. Albert Berg von Linde, R. M. B. Schjölberg, Prof. Hjalmar Sjögren, Ivar Persson Henning, Vice-Consul Lloyd Lundström and Prof. Carl Sjunnesson, directors; Andreas Quale, mgr.; Fr. Carlsson, mine supt.; P. Kjölseth, mill supt.; J. Westly, smelter supt. Organized 1890, in Sweden, capitalization 3,000,000 kroner, increased 1906, to 6,000,000 kroner, and again increased 1908, to 8,000,000 kroner, shares 500 kroner par; issued 7,021,000 kroner. Paid a 6% dividend, amounting to 360,000 kroner, 1907, and has paid total dividends, to end of 1911, of 2,460,000 kroner. Annual meeting, in May.

Property, 253 claims, 55 acres, with a 1¼-acre mill site, and 193 sq. miles of miscellaneous lands, more or less mineralized, mainly in the Fauske district of Nordland. Lands include the Sulitjelma, Carlotta, Giken and Altens groups of mines. The company also owns the Vaddasguisa mine, in the Oksfjorddalen, in Skjervö and Kvaenangen herreds, the Vaddasguisa being the largest and best ore deposit so far known in the Oksfjorddalen.

The Sulitelma mines are situated within the Arctic Circle on the shore

of Lake Langvand, 400' above sea level and 12 miles E. of Fineidet, a port on the Saltenfjord. Discovered 25 years ago, they have been developed to an enterprise in which 1,600 workmen are employed and in which the Knudsen pyritic smelting process was invented and is still in operation. The ore consists of cupreous iron pyrite disseminated through mica-schist and sometimes found in massive state. This ore occurs in very long and narrow lenses on the contact between schist, amphibolite and olivine gabbro, the lenses running E.-W. on the N. side of the lake, changing to N.-S. on the S. side of the lake. There are 17 outcropping orebodies, 15 under development, which range from $1\frac{1}{2}$ to 30' in thickness, from 200 to 2,500' in length and 1 of them has been proven to a depth of 3,700'. The ore is sorted by hand and 4 grades produced; the first, called sulphur ore, contains 3% copper, 44% sulphur, and is shipped to acid makers; the richer ore carries 6% copper and 32% sulphur, and is smelted at the mines; the concentrating ore with 1.8% copper and 22% sulphur, is treated by water concentration and by the Elmore process. The waste, carrying 0.25% copper and 3% sulphur, is thrown on the dump.

Development is mainly by tunnel, there being 13,600' of crosscuts and 37,400' of tunnels, all in ore, at the end of 1912. The underground work is estimated to develop 2,502,000 metric tons of ore with 1,200,000 tons blocked out for stoping, 1913. Ore in sight at the present time is reported to be 1,900,000 metric tons. Underground haulage is by electricity.

The output, as mined, is divided into 2 classes, smelting ore with 4 to 8% copper and export or pyrite ore, with 1.5 to 4% copper, and an average of 45% sulphur. The total ore mined averages 2.45% copper and 45% sulphur. Of the sulphur ore exported, about 90% is fines and 10% lumps, shipped to various points in Norway, Sweden, Denmark, Great Britain and the Continent.

Power equipment includes a 970-h. p. hydraulic plant, 1,220-h. p. electric plant, 780-h. p. pneumatic plant and 10-h. p. gasoline plant. Equipment includes 17 hoists, of 5 to 30 h. p. each, good for depths to 900'. There are 5 air compressors, 3 at the mines and 2 at the smelter. The mine has 2 pneumatic drills, 1 Temple electric drill and 18 pneumatic hammer drills in service. There are 3 sawmills, a general store, 3 schools, a church and a Good Templars' lodge, with a large number of dwellings for employees, the company owning a total of 320 buildings.

There is an extensive system of aerial tramways, with 15 stations and 2 power stations, the tram system including a 4-mile line to the Jakobsbakken mine, which is to be operated more extensively in the future.

The frame concentrator, of 36,300 sq. ft. area, is equipped with 3 Hadfields and five 13x24" Krupp Grusonwerk crushers, 15 sets of rolls, 76 Hartz jigs, 17 Ferrari concentrating tables, 1 slime table and 62 sizers.

There is a separate mill of 12,800 sq. ft., containing an Elmore vacuum oil flotation plant, the largest Elmore plant in the world having 18 units, with a productive capacity of about 25,000 tons of 6.5% copper concentrates yearly. The plant went into commission April, 1909, and in the first year of operation produced about 8,000 tons of remarkably clean copper concentrates, carrying 6.75% copper, with an extraction of better than 80% of assay values. This Elmore plant is not only the largest installation in existence, but has given perfect satisfaction, redeeming all promises. Many small Elmore units, installed at other copper mines in other parts of the world, have proven unsuccessful, but the high saving and low costs of the Elmore plant at the Sulitelma show that the process, under suitable conditions, is a commercial as well as a technical success. The Elmore people state that the plant is operating at minimum working costs, and is consuming, for each

ton of ore treated, only 2.7 lbs. of the cheapest kind of common fuel oil, and no acid. Practically the entire production of the Elmore plant at the Sulitelma has been from tailings that were wasted before the installation of this process. This plant produced 1,163 tons of copper concentrate during Sept., 1913.

The 160-ton smelter, at Fagerlid, 2 to 5 miles from the various mines and receiving ore by aerial trams, has a 50-ton water-jacket blast furnace; 1 reverberatory furnace; two 50-ton pyritic smelting converters of the Kundsen type; 1 Wedge calcining furnace, with 8 hearths, 21' 6" in diameter; 1 gas-fired reverberatory furnace, with hearth 15x60', and 1 converter stand, with 10 shells of the Manhes type, 5' in diameter and 5' 6" in length. First-fusion product is a matte of 30 to 40% copper and final product is blister copper assaying 99.2%, sent for refining to the Helsingborg Kopparverks Aktiebolag, at Helsingborg, Sweden, where there is a leaching plant, in connection with the works. Ores smelted average 6 to 8% copper, 32 to 34% sulphur, 34 to 36% iron and 2 to 4.5% alumina, with traces of lime and magnesia.

The smelter employs the Knudsen discontinuous pyritic process, which largely utilizes the calorific value of the sulphur and requires a minimum coal consumption, effecting a very considerable saving in fuel cost. Pyritic and chloritic ores are smelted, the former yielding a fusible slag, the viscosity of which is much increased by the addition of the chloritic ore. For this reason slag is run into the forehearth and allowed to settle for 90 minutes, after which pyritic fines are added. The Knudsen furnaces, of 20 tons capacity each, are lined with magnesite blocks, set close together and luted with a bond of magnesite mortar and tar, applied hot. The wear is confined to the under portion of the furnace, up to 30 to 50" above the tuyeres, and is comparatively small, the working furnaces having run for 179 to 459 charges before linings required repairing. Two men are sufficient to work a furnace, 2 others attending to the forehearth, each forehearth sufficing for 2 or 3 furnaces. The loss in smelting low-grade ores amounts to 10% only, slags running only 0.2 to 0.3% copper, as against a former loss of about 15% of assay values, and the cost of smelting under the Knudsen process is given as 3s. per ton of ore, this covering wages, transportation of ore to the smelter and cost of fuel. Converter costs are said to be under \$1 per metric ton.

Miscellaneous enterprises of the Sulitelma include the ownership and operation of 7 steamers, 2 tugs, 40 barges, and a 13-kilometer private railway system, known as the Sulitjelmabanen, of 750-mm. gauge, equipped with 3 locomotives and 120 freight cars.

Production, for 1904, was 605 metric tons fine copper and 90,000 tons cupriferous pyrites exported, containing 2,442 metric tons fine copper, giving a total production of 7,614,688 lbs. fine copper; 10,479 tons of ore smelted, yielding 447 tons fine copper and cupriferous pyrites exported giving a total output of 6,225,856 lbs. fine copper in 1905; 589 metric tons fine copper and about 2,800 tons of copper contained in cupriferous pyrites exported, equivalent to about 7,000,000 lbs. fine copper, in 1906; 1,384,486 lbs. fine copper from ores smelted, and 102,000 metric tons of cupriferous pyrites exported, averaging 3% copper, giving a gross production of 8,140,562 lbs. fine copper, in 1907; 120,000 metric tons of cupriferous pyrites exported, 18,000 tons of copper ore and 8,000 tons of Elmore concentrates smelted, yielding 1,100 metric tons of Bessemer copper, with total copper contents equal to about 9,000,000 lbs. fine copper, in 1910.

In 1912, a total of 123,250 metric tons of cupriferous pyrites was exported and 14,850 tons copper ore with 11,500 tons of Elmore concentrates

were smelted, giving a gross production of about 11,000,000 lbs. fine copper. The Sulitelma has by no means reached the limits of its productive capacity, though by far the largest copper producer of Norway, and one of the richest copper mines of Europe. The management is progressive and competent, and has shown a high degree of technical ability in the successful utilization of the Knudsen system of discontinuous pyritic smelting, and the Elmore vacuum oil flotation process.

SUMITOMO COPPER CO.

JAPAN

Office: 36 Unagidani Minamiku, Osaka, Japan. Mine office: Niihama, Iyo, Shikoku, Japan. Works office: Shisakajima-Ochigun, Iyo, Shikoku, Japan. Kichizaemon Sumitomo, proprietor; M. Suzuki, director-in-chief; Munio Kubo, mgr.; preceding officers, Kinkichi Nakada, and K. Yukawa, directors; S. Maki and J. Matsumoto, sub-mgrs.; K. Arai, mine supt.; Keijiro Nakamura, smelter supt.

Owms the Besshi mine and other properties comprising 3 claims, 6,353 acres, besides a 5-acre mill site, 33,452 acres timber lands and 575 acres miscellaneous lands, in the Besshi district. The Besshi mine proper, on Besshi mountain, 4,400' in height, has an area of 209 acres. The timber lands carry large plantations of fir, set out yearly since 1879, which have now become available for mine timber, 15 to 20 years growth being required. Water supply is taken from the Kokuriu river.

The Besshi mine is situated near Kobe, 10 miles from the sea and 4,000' above it. It has been in the possession of the Sumitomo family for more than 200 years, being successfully worked by native methods until 1874. In that year modern methods of mining were adopted and the property is now the second largest mine in Japan.

The Besshi copper deposit is a bedded vein occurring in crystalline schists considered to be of Archæan age and characterized by chloritic and graphitic schists with serpentized dike rocks in the hanging country. The ore deposit itself is a vein of crushed quartz schist conformable in strike and dip to the enclosing rocks, but broken when they were folded. The vein is traceable for 6,000' and has an ore shoot which is 5,000' long, 2 to 25' and averaging 7' thick, that has been developed to a depth of 2,150' without decreasing in size or value. The ore is a mixture of chalcopyrite and pyrite interbanded with schist and carries from 3 to 4% copper, singularly free from other metals, the smelter product selling at Lake Superior copper prices, without electrolytic refining. Numerous parallel E.-W. stepfaults throw the orebody 10 to 20' and rarely 50'.

Development consists of an inclined shaft, 1,700' deep on the dip, with various adits driven to connect the workings with the surface. The main working level has been the third adit, a haulage and drainage way, 10x11' in section and 6,000' long. This adit carries a stream through the mountain which has a fall of 1,800' after leaving the mine and generates 6,000 kw. The latest work is a fourth adit, 16,000' long, from Hateba, the end of the private railway conveying ore from the mine to the sea. A shaft 16' in diameter and 1,875' deep is being sunk vertically from No. 3, or main working tunnel, to meet the new level. A face 10x13' is advancing in the tunnel at the rate of 200' per month.

The orebody is worked by ordinary overhand methods and the output is sorted at the surface into lump ore, constituting 70% of the product, fines 20% and waste 10%.

The mine has 9 main levels with largest production from the 6th and 7th levels. There is a system of natural ventilation by which warm air from the valley entering through the Tonaru tunnel escapes through the mouth of the Toyen shaft, near the crest of the mountain, the air current being reg-

ulated by brattices. The mine has 61,268' of workings, with about 2,500,000 tons of ore blocked out for stoping. The mine is well timbered, with a tram line on each level, and ore is blasted with guncotton, a little dynamite and occasional gunpowder. Electric pumps fork water from the lower workings to a large sump on the 8th level, whence it is discharged through the Tonaru tunnel which is lighted throughout by electricity and has the terminal station of an aerial tram at its portal.

The Nishinokawa mine is at Oboki-mura, Nii-gori, Iyo, Japan. This property shows quartz-schists with lenses of 3 to 12' width carrying chalcopyrite ore with 3 to 4% copper, associated with sphalerite, pyrite, magnetite and hematite, with quartz gangue. The mine employs an average of 225 men.

Mining equipment includes a 1,000-h. p. electric installation having three 200-h. p. electric hoists, good for 1,200' depth each, with three 120-h. p. Rand, two 120-h. p. and one 75-h. p. Leyner, and one 50-h. p. Schramm air compressors. As ore extraction is mainly through No. 3 tunnel, no exceptionally powerful machinery is required.

The concentrator at the mouth of the Tonaru tunnel, is of 700 tons daily capacity, equipment including 2 Blake crushers, 4 belt conveyors and 4 trommels, ore being assorted mainly by hand labor.

Owing to complaints by farmers of damage from copper-laden waters, a cementation plant was installed several years ago, and considerable copper is precipitated on scrap iron and coke, the production of 80% cement copper amounting to upwards of 200 tons yearly.

A 3,600-meter Bleichert aerial tram leads from the mill and tunnel to the railway at Hateba, this having a longest span of 600 meters, with an hourly capacity of 90 tons at an average speed of 2.5' per second. Hateba is the terminus of a railway running to Niihama, the nearest port. The connections between the mine and shipping wharf include about 2 miles of aerial tram and several miles of railway. The mine also has 3 aerial trams of 2,276', 5,200' and 5,178' lengths, respectively.

The company owns 2 private railways of 9.73 miles aggregate length, with 30" gauge, rolling stock including 10 locomotives, 10 box cars and 184 ore cars.

The company operates 3 electric plants, 2 driven by steam and 1 by water. The steam plant at the mine and hydro-electric plant at Otoshi, on the Kokuriu river, distribute electric energy to the mine, mill and shops, while the steam-electric plant at Shisaka furnishes power to the smelter.

The general shops at Niihama, about midway between the mine and smelter, include a foundry making castings up to 5 tons in weight, extensive carpenter shops, machine shops, boiler shops and smithies, these works not only making ordinary repairs, but turning out a large part of the machinery and castings used at the mines, works and smelter.

The Besshi smelter formerly was at Niihama, but owing to serious damage to neighboring farmers from smelter fumes, was transferred 1906, to the Island of Shisakajima, 12 miles from Niihama, only the general shops remaining at the old smelter site.

The new Shisakajima smelter, 20 miles from the mine, built at a cost of about 4,000,000 yen, is thoroughly modern in design and equipment. Ore is received from barges, strings of 10 being towed by tugs 10 miles and unloaded by a 20-ton crane, into cars operated in counterbalance, on an incline leading to the top of the works, which are laid out in 7 terraces, gravity being used throughout for the flow of material.

The smelter handles 600 metric tons daily of ore containing 30 to 33% sulphur mixed with 7% gneiss as flux and 4 to 5% coke. The fines are

nodularized with flux and water in a revolving conical wooden cylinder and afterwards pot-roasted in Nakamura roasting pots. The sintered ore, with lump ore and coke, is fed to the first blast furnaces which make a 20% matte and an 0.2% slag. This first matte is smelted a second time, making 33% matte and 0.3% slag.

The furnace building has four 160-ton 39x192" blast furnaces, of partial water-jacket type for ordinary or pyritic smelting, and a 400-ton 48x288" blast furnace for pyritic smelting. There are four 37-metric ton circular blast furnaces, each with a corresponding light reverberatory forehearth, with blast, for smelting roasted matte and making blister copper. There are two 15-metric ton reverberatories for refining, 1 being used as a spare, and 4 sets of Mabuki hearths, using an old Japanese process, improved by the Sumitomo Co., for the conversion of matte, these having a daily capacity of 32 tons of roasted matte each, 1 being held as a spare. Barren quartz pebbles are used for fluxing. No custom smelting is done. The product is blister copper averaging 99.8% in copper tenor, carrying traces of silver and gold. About 20% of the product is sent to the Osaka rolling mill, owned by the Sumitomo family, and the greater part of the remainder is sent to Kobe, whence exported, mainly to Europe.

The smelter power plant has 3 No. 4 and 3 No. 6 Connorsville blowers, and blast for the 4x24' pyritic furnace is furnished by a Curtis steam engine, direct-connected to a turbo-blower that delivers 750 cu. ft. per minute of free air, compressed to 1.24 atmospheres normally, with a maximum absolute pressure of 1.34 atmospheres. Steam for the turbo-blower is furnished at 200 lbs, initial pressure by a Babcock & Wilcox boiler. There is an air compressor for converter blast.

Fuel is coal at the mine, and coal, coke and waste gases from coke ovens at the smelter, coal being used for the reverberatories and reverberatory forehearths, with coal and wood employed for the roast stalls. Fuel costs are 4.2 and 4.7 yen per long ton for coal, according to grade, and 8.46 to 21 yen for coke, yearly fuel consumption being estimated by the management to average 9,333 long tons of coal and coke. The company has a coking plant at Niihama with 72 brick kilns, having a daily capacity of about 55 tons, using coal from the Keeki mine at Kiushiu.

The company owns a very extensive fleet of vessels, including 2 steamers for passengers and package freight, 1 steamer for carriage of coal, and 81 sailing vessels, with 20 sailing vessels held under charter. The company operates a passenger line, with a steamer plying between Niihama and Kobe, a distance of 125 miles.

The Besshi mine employs about 3,000 and the various enterprises of the company employ about 4,800 hands. The miscellaneous enterprises in connection with the Besshi mine are very extensive, including a large number of warehouses and stores, and a branch of the Sumitomo bank at Niihama. The company maintains a main hospital, with 4 branches, and supports 5 elementary schools for the children of employees.

Production of the Besshi mine was 11,973,833 lbs. fine copper in 1906, 11,781,824 lbs. in 1907, 11,476,519 lbs. in 1908, 14,725,305 lbs. in 1910, 15,145,070 lbs. in 1911 and 16,968,866 lbs. in 1912, at an estimated cost of between 9 and 10 cts. per pound for finished copper.

SUNDHEIM; SOCIEDAD COLECTIVA C. y J.

SPAIN

Office: Huelva, Spain. Mine office: Puebla de Guzmán, Huelva, Spain. Is an incorporated copartnership between Don Carlos Sundheim de la Cueva and Doña Justa Sundheim de la Cueva. Wm. Guthrie Bowie, mgr.; Jorge Riecken, mine supt. Property includes the Cabezas del Pasto, Monte Rubio,

Sierracilla del Tamujoso and Malagón mines, the first being under lease to the United Alkali Co., Ltd., and described under title of that company.

The Monte Rubio group includes the Monte Rubio, Gibraltar and Atbalcal Arbalcal mines, having a combined area of about 100 hectares, at Paimogo Huelva. These are ancient properties, worked only to the level of the nearest stream, in the Roman era, the old workings, though comparatively superficial, disclosing enormous masses of ore occurring as oxides, sulphides and sulphate, with gangue of iron ore, indicating the existence of large bodies of unaltered iron-copper sulphides at greater depth.

The Sierracilla del Tamujoso was a small producer, under former operators, but the ore is complex, requiring special treatment, and the property has been idle for some years. The Malagón is a group of government concessions, showing good outcrops, with numerous old workings, but also has been idle some years.

SUNIK MINES.

RUSSIA

Mine office: Evlach, Zangezhur, Transcaucasia, Russia. Lands, 30 miles from Evlach, on the Tiflis & Baku railway, near the Persian line, carry a system of fault fissures, of 7" to 4' width, cutting andesite and diabase. Development is mainly by tunnel, with 2 shafts, and workings are of a primitive nature, deepest being only about 130', at last accounts.

Twenty veins are known and those opened in mining show ore characterized by chalcopyrite, with occasional bornite, the output averaging 7% copper with gold and silver values.

SWAKOPMUNDER MINEN-GES.

GERMAN S. W. AFRICA

Office: Schellingstrasse 4, Berlin, Germany. Mine office: Gorob, via Swakopmund, German S. W. Africa. Organized under laws of Germany, capitalization 36,000 marks, to take over the Gorob mine and sundry other rights of the Deutsche Kolonialgesellschaft of the Southwest Africa Co., in the Guisib district. Property but slightly developed, at last report.

SWEDISH METALS EXTRACTION CO., LTD.

SWEDEN

Office: 19 Coleman St., London, E. C., Eng. Mine office: Falun, Dalarne, Kopparbergslän, Sweden. Col. F. Soratt Bowring, C. B., chairman; A. B. Lucas, sec. Organized July 5, 1907, under laws of Great Britain, as the Naversburg Falun Copper Mines & Works, Ltd., and name changed to present title, Nov., 1910. Capitalization £100,000, shares £1 par, in 20,000 "A" shares, and 80,000 "B" shares, increased, Aug., 1909, to £250,000, shares £1 par. No reports on recent operations, and company presumably is idle.

TACNA; SOCIEDAD BENEFICIADORA DE METALES DE. CHILE

Idle. Works at Tacna, Chile. Organized 1901, in Chile, capitalization 68,250 pesos, shares 250 pesos par. Company owns a smelter making matte of 50% copper when in operation.

TADERGOUNT MINE.

ALGERIA

Idle. Stora, Fietta et Cie., owners, Bougie, Philippeville, Algeria. Lands, 34 kilometers S. E. of Bougie, show a number of veins, in schist and shale, carrying gray copper and oxidized copper ores. The mine, slightly developed, has been abandoned several times, owing to flooding.

TAGLE; SUCESIÓN RUIZ.

CHILE

Mine office: Naltagua, Melipilla, Santiago, Chile. Property includes La Trinidad smelter, 9 miles from Talagante, having a 54" cylindrical water-jacket blast furnace and a 15-h. p. engine. Matte produced is exported to Europe. Last production reported, 1908, was 500,000 lbs. fine copper, secured from 3,840 metric tons of 6.5% copper ore smelted. The smelter was idle in 1909-10.

TALYSARN COPPER MINES, LTD.

WALES

Secretary and office: G. A. Scott, 5 Great Winchester St., London, E. C.,

Eng. Mine at Nantlle Vale, Talysarn, Carnarvon, Wales. T. W. Druitt, F. Hughes, directors. Merricks, Crane & Co., cons. engrs. Organized Feb. 23, 1907, under laws of Great Britain, capitalization £60,000, shares £1 par; issued, 59,500 shares. There are £15,000 six per cent first-mortgage debentures. Production 1911, 228 tons, averaging 18% copper.

TAMA MINE.

CORSICA

Mine office: Bastia, Corsica, France. Is a small producer of sulphide copper ore, shipped to Great Britain for reduction. No recent returns secured.

TAMAYA; SOCIEDAD ANÓNIMA DEL MINERAL DE.

CHILE

Mine office: Tamaya, Ovalle, Coquimbo, Chile. Organized 1906, under laws of Chile, capitalization 3,000,000 pesos, shares 20 pesos par. The company gave 1,360,000 pesos in shares for the property, and issued 1,240,000 pesos stock for capital, holding 400,000 shares in the treasury, for reserve.

Lands, 206 hectares, on the Cerro Tamaya, 5 miles from the railway station of San José. The property shows a N.-S. vein of variable width, with dip of about 45°, said to have a payshoot 20' wide, of high-grade ore. The property includes a number of mines which have produced considerable copper in the past, the mines having about 10,000' of workings, deepest of 2,300'. Development is mainly by a tunnel of 7,380' length. Management planned a very complete electric equipment, to include motors and hoists, traction engines, pumps and lights, but no traces of this work have been found. The mine is considered valuable, and if developed on a modern scale, with adequate capital, is believed to be capable of making a good mine.

TAMBILLOS SMELTING & MINING SYNDICATE.

CHILE

Idle. Mine office: Peñon, La Serena, Coquimbo, Chile. Capitalization £20,000, shares £100 par. Property is the San Felipe mine 1.2 miles from Peñon, having a 3' vein opened to depth of 160' and for length of 820'. Ore, carrying chalcopryite, associated with iron oxides, is used mainly for flux. The smelter, at Tambillos, completed 1908, receiving ore from the mine at a freight charge of 2 pesos per metric ton, has a 45" circular water-jacket blast furnace, 16-h. p. boiler, 20-h. p. engine and No. 4 Connorsville blower. About 25 men are employed, normally. Production was 550,000 lbs. fine copper, in 1908. The smelter went out of blast in 1910 and is still idle, but management hopes to resume production shortly.

TAMBORAQUE; FUNDICIÓN DE.

PERU

Owned by Lizandro A. Proaño, at San Mateo, Lima, Perú

TANALYK CORPORATION, LTD.

RUSSIA

London manager and secretary, and office: J. P. Webster, 80 Bishopsgate, London, E. C., Eng. Mine office: Tanalyk, Orenburg Government, Russia. Leslie Urquhart, chairman; Baron V. V. Meller-Zakomelsky, T. Blair-Reynolds, R. Gilman Brown, V. V. Romanoff, Capt. H. A. R. Scott, directors. Organized April, 1912, under laws of Great Britain, capitalization £300,000, shares £1 par; fully issued and fully paid, to acquire entire share capital of the South Urals Mining & Smelting Co., organized under the laws of Russia.

Property, 22 mining claims in Orenburg Government, 9,590 acres, held on 70-year lease, and timber rights, expiring 1931, on 300,000 acres of forest. In addition has exclusive prospecting rights over 3,000 sq. miles with rights to take up further 17,000 acres of mining claims.

The 5 copper deposits now being developed have sulphide ore averaging 7% copper, 1 oz. gold and 5 oz. silver. Certain ores also contain zinc in payable quantities and experiments are being made for separation of this metal before final reduction plant is decided upon. Reverberatory furnaces to treat the less zincy ores are now building and should be in operation in

1914. There are also valuable gold quartz veins which are now being developed, besides large deposits of manganese.

An experimental smelter of 550 tons monthly capacity was started in July, 1913, and proving satisfactory, a new smelting plant to handle 7,500 tons is planned.

It is reported that the capital of the company is to be raised to £450,000 by the creation of 150,000 additional shares and that an issue of £200,000 in 6% convertible bonds is to be made.

TANGANYIKA CONCESSIONS, LTD.

BELGIAN CONGO & RHODESIA

Office: Friars House, New Broad St., London, E. C., Eng. Mine offices: Kambove, Katanga, Belgian Congo, and Kansanshi, Northwestern Rhodesia; Tyndale White, chairman; Robt. Williams, managing director; John Wm. Broomhead, Lord Arthur Butler, T. P. Heyvaert, Thos. Honey, Sheffield Neave and C. F. Rowsell, directors; L. Scotland, sec.; Robt. Williams & Co., mgrs. and engrs.; Allan Gibb, chief engr.; Thos. Bayne, engr.; F. E. Studt, geologist; A. G. Keith, Rhodesian agt.

Organized Jan. 20, 1899, in Great Britain, capitalization £1,000,000. Original capitalization was £100,000, successively increased Dec. 1901, to £184,000, in 1902 to £194,000, in 1903 to £264,600, in April, 1905, to £450,000, in July, 1905, to £525,000, and in Nov., 1906, to present amount; shares £1 par; issued, 944,098, May 30, 1913. Debentures £2,600,000 authorized, at 5%, in denominations of £8; outstanding £2,241,823, including further interest account, May 30, 1913. Col. Sir Howard Melliss, K. C. S. I., and Hon. Arthur Stanley, M. P., are trustees for the debenture holders. The debentures are redeemable at par Jan. 1, 1917, or at option of the company on 6 months' notice, after Dec. 31, 1911. Interest paid in cash.

The property of the company, Sept. 30, 1912, consisted of a 50% share interest in the Compagnie Union Minière du Haut-Katanga amounting to 50,000 shares of f100 par and 48,000 dividend shares; 75% of the issued stock of the Rhodesia-Katanga Junction Railway & Mineral Co., Ltd., amounting to 500,750 ordinary £1 shares, 44,500 "B" 1s. shares, the Kansanshi copper mine having been sold to this company; 1,600 shares of f250 par in the Compagnie du Chemin de Fer du Katanga; £2,700,000 stock and £334,300 5% bonds of Companhia do Caminho de Ferro de Benguela; 2,297 shares of £4 each of the Intertropical Anglo-Belgian Trading Co.; 51,853 shares of fully paid £1 shares and 19,996 shares of £1 par, 1s. paid, of the North Zambesia Concessions, Ltd., and £5,000 of the 3% debentures of the Rhodesia Railways, Ltd.

The Tanganyika Concessions, Ltd., has an arrangement with the Zambesia Exploring Co., Ltd., by which the latter is ready to finance the former until the company is independent. The Zambesia Co. has practically the same officers as the Tanganyika, and floated the latter, the former having a capitalization of £700,000, shares £1 par, with 666,855 shares issued, fully paid, and an authorized debenture issue of £250,000, secured by 100,000 shares of Tanganyika. The Zambesia Exploring Co., Ltd., paid a 100% dividend Feb. 7, 1896, and for the year ending June 30, 1912, showed a profit of £13,468. The accounts for the year ending Sept. 30, 1912, submitted May, 1913, show a loss of £136,116 compared with loss of £226,787, for 15 months ending on like date 1911, both amounts being deducted for share premium account.

This company was formed to acquire from the British South Africa Co. a 2,000-acre concession in Northern Rhodesia for a terminal and town site of the Cape to Cairo railway at the S. end of Lake Tanganyika; a 2-year exclusive right to prospect and locate for minerals in an area of 2,000 sq. miles

N. of the Zambesi and to locate 1,000 claims in B. S. A. territory. For these concessions, the company gave £60,000 in fully paid shares, besides which the B. S. A. Co. retains a 35% interest in all mines. Having made important discoveries and located various mines in the borderland of the Belgian Congo, the Tanganyika sought and obtained another mineral concession, covering 60,000 sq. miles of the Belgian Congo region, known as the Katanga, and adjacent to the Rhodesian properties of the company. The Special Committee of Katanga reserved 60% of the net profits and received £30,000 in fully paid shares. An extension of this concession and an interest in the Benguelle railway later increased to 90%, was acquired in July, 1902, for £10,000 in fully paid shares.

The mineral discoveries in the Belgian Congo cover a copper belt 200 miles long with over 100 known copper deposits; also a tin belt, 110 miles long, with workable deposits; also gold and iron mines and diamondiferous areas.

The Tanganyika Co. has sold its holdings to subsidiary companies controlled by it and thus becomes a parent holding company only. In the Belgian Congo, 72 large mining concessions were located, the company engineers estimating 1908, that 5 of these claims showed 9,500,000 tons of 6.3 to 14% copper ore, most of which could be extracted opencast, while on another group, the company estimated 1,500,000 tons in sight, of 13% copper tenor.

The copper interests of the Tanganyika Concessions, Ltd., consist at present almost exclusively of its holdings mentioned above in the Union Minière du Haut Katanga and the Rhodesia-Katanga Junction Railway & Mineral Co., Ltd. (Kansanshi). The copper deposits and mines owned by the Union Minière were discovered by prospectors employed by Tanganyika Co., under the terms of the concession from the Comité Spécial du Katanga. These deposits are scattered through a practically uninterrupted belt of country extending from the Rhodesian border in the S. E. corner of the Katanga region to the W. bank of the Lualaba river, a distance of 180 miles in a N. W. and W. direction. This copper belt is a region of rounded hills and steep sided valleys, 4,000 to 5,000' above sea level, the copper areas being bare, due to copper salts. The copper ores occur in sandstones and in schists, slates and limestone, the beds running W.-N. W. and dipping steeply. The ores are oxidized, malachite being the most abundant mineral associated with chrysocolla and azurite, while melaconite is found mixed with wad. The orebodies are lenses that vary from small deposits up to mammoth ones such as Kambove No. 2, said to be 3,000' long, 240 to 400' wide and to hold 10,000,000 lbs. of 15% copper ore to a depth of 100'.

The Star of the Congo mine, in the Belgian Congo, was the first to be reached by the railway extension from Broken Hill in Rhodesia and the first to be developed and worked. Development work at this mine comprises 20 shafts, a total of 1,250', about 3,000', of crosscutting and a main haulage tunnel open at each end, driven 1,500' through the deposit, at a depth of 80 to 90', or just above water level. This tunnel is equipped with rope haulage and a double track for ore trucks.

The deposit is being mined by opencuts, the ore after breaking being milled down through winzes to the crosscuts below and hauled out through the main tunnel to the surface. The rich ore goes direct to the smelter, but the bulk is washed, sorted and concentrated before it is sent to the furnace.

The Lubumbashi smelting works are 8 miles from the mine on the main railway line. The plant contains two 48x192" water-jacket blast furnaces, smelting about 4,000 tons of ore monthly. During 1911-12, the furnace was in blast for 3 smelting campaigns, aggregating 228 days, and

treated nearly 30,000 tons of 12 to 15% ore in a single furnace. The product was 3,000 tons of bar copper averaging 93% pure copper, obtained with a consumption of from 2.65 to 3.44 tons of coke per ton of copper. The second furnace was ready for work in Nov., 1913. The smelting work has been greatly handicapped by a shortage and the high cost of fuel, European coke costing £12 per ton. Coke is now being regularly supplied at the rate of 1,500 tons a month from the Wankies coal mines in Rhodesia, a distance of 725 miles on the main railway. This coke costs about £6 a ton delivered at the smelter, the colliery's entire coke output being bought by the Union Minière up to the end of 1913. A battery of 22 coke ovens is being built at the Lubumbashi works, which, at the end of 1913, will produce 1,200 tons of coke a month, costing about £4 a ton. The Wankies coal mines have contracted to supply the Union Minière with washed coal for 5 years at £6 6s. to £7 6s. a ton, with 2,000 tons minimum and up to 5,000 tons a month. A second battery of 22 coke ovens is to be erected when the first is finished.

The Kambove mine is the largest and most important copper mine owned by the Union Minière. It is 100 miles N. W. of the Star of the Congo and is now reached by the railway and can ship its ores to the Lubumbashi smelter. A 2-compartment haulage tunnel has been driven from the surface through the deposit for 1,500', half through payable ore. The tunnel is equipped with rope haulage and a double track. There are 10 shafts from 100 to 50' deep to the level of this tunnel and 5 bore holes put down to about 100' below tunnel level with about 1,600' of crosscutting. Ore will be quarried and milled through the shafts and hauled out through the tunnel. Management estimates 3,000,000 tons of 13.4% copper ore in sight above the tunnel level and a similar quantity of probable ore in the 100' below. The Kambove is situated 1,720 miles from the seaport of Beira, by rail, and is reported to be able to produce 500 tons of ore daily in 1913.

The Luiswichi and Luusha mines, 30 miles from the Star, have been developed recently and results being satisfactory, they will be equipped and worked, supplying ore to the Lubumbashi smelter.

On all the other deposits forming the copper belt varying amounts of prospecting and development work have formed the basis of estimates, some of which are as high as 300,000,000 tons of copper ore in sight over the whole copper belt.

The Bukama tin belt of the Union Minière is an area in the Katanga containing tin deposits on which development work was commenced in 1913. The belt is near Bukama, on the navigable Lualaba-Congo route from the West Coast, and 210 miles from Kambove, with which place it is being connected by rail, and should be working its valuable ores by the end of 1914.

The Kansanshi mine, transferred in 1909 to the company's subsidiary, the Rhodesia-Katanga Junction Railway & Mineral Co., Ltd., lies at an elevation of 5,000', about 12 miles S. of the Congo-Zambesia divide, which forms the boundary between Rhodesia and the Belgian Congo. This property shows extensive remains of ancient opencut workings, there being trenches and pits for a distance of 6,000', which form 6 chains or lines of workings, in which the pits vary from 1 to 30' in width, 5 to 30' in depth and 300 to 1,300' in length.

The Kansanshi copper deposits consist of beds, 1 to 10' thick, of sandstone impregnated with copper and resting on limestone and schist. The sandstone is micaceous and fissile in places and more or less charged with malachite particles and flakes, the upper beds carrying malachite and chrysocolla, with occasional occurrences of azurite and melaconite, and some cuprite, with silicious gangue, and some manganese dioxide in the superficial portions. The gangue carries a little limonite, usually ochrous. Sur-

face ores are said by Mr. John R. Farrell to show no evidence of having resulted from alteration of sulphides in place, the facts leading him to the opinion that the malachite was deposited from hot solutions, coursing in fissures. The ore is highly silicious.

The main ore bed, known as "D" reef, averages 8 to 10' thick, with 5 to 10' of sandstone impregnated with malachite on each wall of the vein; the ore as mined is said to average 18.7% copper with \$2 gold per long ton. Sulphide ores, with bornite and chalcopyrite associated with pyrite, show in the deeper workings, but the depth of the oxidized zone has not as yet been determined.

Development includes 5 shafts, sunk in old opencuts, on ledges or beds 1 to 16' thick. The main shaft, of 300' depth, is on "D" reef, which averages 8 to 10' wide and has been opened for a distance of 1,000', on the 85' level, and a second level, at 134'. The "E" reef, of 2 to 3' width, and another reef of about 4' width, have been opened for nearly 500' on the 85' level. An 8' vein with limestone walls is reported to average 10.5% copper on the 200' level.

The Kansanshi mine has produced up to May, 1913, 2,500 tons, or 5,600,000 lbs. of copper, smelted in a small blast furnace made at the mine and using charcoal as fuel. The transport of this tonnage cost about £6 per ton from Kansanshi to Baya, on the railroad.

The mine is being developed and a concentrating plant as well as extensive pumping machinery were installed, 1913. The property is 80 miles from the main railway and both ore and supplies are transported by traction engines.

The company's success in opening up a vast territory in Central Africa, building railways and developing great mining interests, has been very largely due to its energetic managing director, whose unbounded optimism has carried the company over difficulties that would have swamped a more conservative management. The company has, however, paid a good price for these services, the contract, 1905-11 securing Mr. Williams 10% of the net profits of the company's assets representing profits. The financial part of the company's affairs have also been much criticized on the ground of excessive royalties exacted amounting to 60% of the net output of the Belgian properties, while only 65% interest is owned by the company in the Rhodesian properties it has spent so much money in developing.

The company's subsidiaries are now producing about 12,000,000 lbs. of copper yearly, at a reported cost of 9.1 cts. per lb., but it will be many years yet before the world will be flooded with the copper produced in Central Africa, as was feared when the company was first formed. While the early statements issued greatly exaggerated the present conditions, and the results of 13 years' work and the expenditure of \$33,000,000, have not yet brought the company to a dividend-paying stage, it has demonstrated the worth of the properties. Great credit must be given Mr. Williams for his energy and perseverance in bringing this great enterprise to its present condition. The company has heretofore given out very little real information, especially about its financial affairs, but the tide having turned and the enterprise being now fairly under way, fuller reports will doubtless be given. The company still has the problem of treatment of the great silicious copper deposits to solve and the Benguela railroad to build, but these problems are not unsurmountable if money is available.

The remarkable development that has taken place in the Katanga copper country can be realized more fully perhaps when it is remembered that the European population at the Star and Elisabethville numbered 2 in 1907

and now number nearly 2,000, according to official returns from the Belgian Colonial office.

TARAPACÁ DE COLLAHUASI; COMPAÑÍA MINERA. CHILE

Idle. Office: Valparaiso, Chile. Mine office: Collahuasi, Tarapacá, Chile. Organized Jan. 10, 1906, under laws of Chile, capitalization £50,000, shares £1 par.

TARAPACA COPPER QUARRIES, LTD. CHILE

Secretary and office: E. T. Evans, Finsbury Court, London, E. C., Eng. Mines at Huiquintipa, Chile. R. H. U. Ellis, H. W. Whyte and J. S. Enright, directors. Organized Jan., 1912, as successor to the Copaquire Copper Sulphate Co., Ltd., capitalization £350,000, shares £1 par; issued, 30,007.

Lands, 25 claims, 50 hectares, in 2 groups. The Huiquintipa group of 13 claims, at Huatacondo, carries diopase and chrysocolla, these silicates of copper occurring as the cementing material in a conglomerate bed up to 85' thick. Company estimated 6,000,000 long tons of 3.25% ore exposed.

The Copaquire group shows granite country rock, carrying an abundance of oxidized copper minerals, mainly copper sulphates and sub-sulphates averaging 2.5 to 3% in copper tenor. The management of the former company stated that the deposits were natural bluestone, with some impurities mechanically mixed therewith, but, as a matter of fact, the ore consists of a mixture of 3 different salts, and is similar to that of the Chile Copper Co. at Chuquicamata. The old company's "experts" have estimated that the Copaquire deposits show upwards of 100,000,000 long tons of ore worth £20,000,000. Development is by a 150' shaft and about 1,000' of opencuts and trenches.

Equipment includes a 45-h. p. steam plant, warehouse, office and laboratory of stone, to withstand numerous and severe earthquake shocks. The lixiviation plant, covering about 1 acre, is rated at 500 tons daily capacity, with a dehydrator for drying crystals of bluestone. Mine and leachery are connected by a 4,000' tram line. Nearest railway is 70 miles distant, transport between being on the backs of mules, over rough mountain roads. Soft coal costs £8 15s. per ton delivered, but this price being prohibitive, yareta is burned mainly for fuel. This is a gigantic club-moss, having a lob of resin, a single cluster occasionally weighing more than a ton.

TARAPAQUENA DE CHAÑARAL; CIA. CHILE

Mine near Angostura, Atacama, Chile. Lands, 22 hectares, on the Chañaral railway, 10 kilometers N. of Angostura, with a good wagon road connecting with station. Equipment includes a number of wooden dwellings for workmen. No recent returns secured.

TARAWERA GOLD MINING & SMELTING CO. NEW ZEALAND

Mine at Otago, Otago Co., N. Z. C. E. Storie, consulting engineer. Capitalization £25,000. Lands, on Preservation inlet, carry several orebodies said to average about 4% copper, with gold and silver values worth more than the copper. A smelter, planned to do custom business, in addition to treating the ores of the company, was erected late 1910. No recent returns secured.

TASMAN & CROWN LYELL EXTENDED MINES, N. L. TASMANIA

Office: 31 Queen St., Melbourne, Aus. British office: Palmerston House, London, E. C., Eng. Mine office: North Mount Lyell, Montagu Co., Tasmania. T. C. Dunster, chairman; W. Coleman, Moss Marks, George Durham and A. Campbell, directors; John Brandon, sec.; Edwin Habben, London sec.; Edw. Carter, mine mgr. Organized March 21, 1907, under laws of Victoria, as a reconstruction of the Tasman & Crown Lyell Mining Corporation, N. L., capitalization £150,000, shares 10s. par, increased from £90,000 in April, 1913. Shares are listed on the London, Melbourne, Hobart

and Launceston stock exchanges. Half yearly meetings, April and October.

Property, 5 claims, 181 acres, leasehold, and mill and smelter sites, etc., 236 acres in all, covering the Mt. Lyell copper-lead belt for half a mile. The claims are 1 mile N. of the Mt. Lyell mine and 6 miles from Queenstown by tram.

The ore deposits occur in the Great Lyell fault which runs N.-S. and brings schist and conglomerate together. Ore shoots occur on the contact, running N. 60° E. and dipping 60° N. W., with ore carrying chalcopyrite and occasional bornite, galena and sphalerite, occurring as impregnations in schist, near a conglomerate contact. The silver-lead ores are of low grade and apparently of small promise, but are succeeded by copper ores at greater depth. The management estimated ore reserves at 35,000 tons, Sept., 1912, averaging 20% lead, 10% silver and 14% zinc. The pyritic lode carries 3¼% copper, 2 to 10 oz. silver and a few grains of gold. This orebody is 8' thick and 200' long, but extent and tonnage are unknown. Development is by a 270' shaft, and several prospect tunnels of 170' and 380'. The most extensive development is on the 3rd tunnel level, 1,610' long, cutting a 7' galena vein at 975', and at 1,443' the conglomerate was reached 270' vertically below the surface.

A 100-ton concentrator was finished, 1911. It contains ten 950-lb. stamps, 1 Wilfley, 1 Card and 6 Phoenix-Weir tables, besides canvas tables for slime; 649 tons of ore was treated giving 77½ tons concentrates carrying 56% lead, and 15.86 oz. silver per ton, with 44 ton middlings of 41.33% lead. Property considered quite promising.

TASMANIAN BALFOUR PROSPECTING ASS'N.

TASMANIA

Letters unclaimed at Mt. Balfour, Russell Co., Tasmania. Dr. Fritz Noetling, chairman; C. P. Smith, cons. engr. Capitalization £3,000, shares £1 par. Lands, 3 blocks, 200 acres, leasehold, showing a gossan carrying about 1.2% copper, with traces of gold and silver, capping a vein reported to be 80 to 100' wide, carrying ore assaying up to 12% copper, 10 dwts. silver and a trace of gold. Was developing with a small force at last accounts. Probably closed down.

TASMANIAN COPPER CO., LTD.

TASMANIA

Secretary and head office: A. Simson, 15 Patterson St., Launceston, Tasmania. London sec. and office: J. G. Coldwells, 348 Winchester House, London, E. C., Eng. Mine office: Rosebery, Montagu Co., Tasmania. Senator J. S. Clemons, chairman; E. M. King, B. Kelly and J. Barclay, directors; F. L. Cox, chairman and F. Clemons, members London Board; G. Barker, mine mgr. Organized Jan. 13, 1897, capitalization £325,000, shares £1 par; 324,210 issued. Debentures £30,000 authorized, at 10%, redeemable at 150; issued, £24,730. Accounts to Dec. 31, 1911, showed a loss of £4,502, increasing the debit balance to £29,936.

Property consists of the Rosebery mine, with 386 acres, on Mt. Black Bear, near the Stitt river, in the North Dundas district. The mine has an orebody that apparently is a replacement deposit, with a schistose footwall, along a line of fault fissuring, with an orebody reported as 5 to 50' wide, and carrying up to 22' of complex sulphide ore, averaging only about 0.5% copper, values being mainly in lead, gold and silver, with some sphalerite. This complex ore is difficult to treat.

Development, by tunnels, longest 644'. Ore reserves were estimated Aug. 31, 1912, at 250,000 tons blocked out above No. 6 level, with further reserves of 283,200 tons probable ore above the main adit level, 118' vertically below level No. 6.

In 1908, company sold its former holdings in South Australia, including

the Blinman and the Sliding Rock copper mines and other leases in the Leigh Creek district.

A contract has been made with the Tasmanian Metals Extraction Co. to treat the company's complex sulphide ore by the bi-sulphite process. They have built a large smelter $1\frac{1}{2}$ miles from the mine and have bought the entire output of the mine. Operations began in 1913. Production for 3 months, May-July, 1913, was 3,174 tons, netting £3,880.

TASMANIAN METALS EXTRACTION CO.

TASMANIA

Office: 21, Army and Navy Mansions, 115 Victoria St., London, S. W., Eng. Works office: Rosebery, Montagu Co., Tasmania. Sir Edw. Durand, Bart, chairman, E. H. Midgley, A. C. I. S., secretary. Organized June 26, 1908, under laws of Tasmania, capitalization £350,000, shares £1 par; 349,846 issued. Accounts to June 30, 1912, showed cash £383, investments £2,660, debtors £1,992, loans £3,148 and creditors £2,820.

Property is a 400-ton reduction plant, planned to treat the output of the Tasmanian Copper Co., Ltd. This ore is a complex sulphide, holding auriferous and argentiferous lead, zinc and copper and will be treated by the bi-sulphite process under license from the Metals Extraction Corporation. The reduction plant, erected $1\frac{1}{2}$ miles from the mine, on the Emu railroad, was started in 1913. The contract calls for payment for silver, gold and lead recovered, and for copper if above one-half per cent and this company hopes to save the zinc for itself.

TELEMARKEN COPPER MINING & SM. CO., LTD.

NORWAY

Formerly owned the famous Aamdal copper mines in Norway, now being worked by the Bandak Electrolytisk Kobbervaerk, and described under that title.

TENIENTE SMELTER.

CHILE

Owned by Braden Copper Co.

TERANO MINE.

JAPAN

Idle. Mine at Saretani-chime, Iyo, Iyo, Japan. Ore is chalcopryite, associated with iron pyrites, carrying 4 to 5% copper. Vein, traversing chloritic schist, ranges up to 7' width, with an average of 12 to 24". Production was 77,291 lbs. fine copper in 1911.

TERRE NEUVE MINING CO.

HAYTI

Address: care Henry R. Tippenhauer, 25 Broad St., New York. Mine office: Port au Prince, Hayti. Organized 1910, in Hayti. Property consists of copper-bearing lands at Terre Neuve, Gros Morne and Gonaives. Claims show a contact belt between limestone and igneous rocks of granitic texture, with contact metamorphic deposits having bornite and chalcopryite in a garnet gangue. There are also the usual oxidized ores and rich sulphides have been found in a few small fissure veins. Property has been examined by W. H. Weed.

TERREMOTO MINE.

BOLIVIA

Sr. Rodolfo Ameller, owner. Mine is in the province of Abarsa, has 40 hectares and produces 45 quintales, 9,920 lbs. copper monthly.

TERRY COPPER SYNDICATE, LTD.

TRANSVAAL

Office: 2 Bussey Bldg., Johannesburg, Transvaal. W. Ballantine, chairman. Organized under laws of Transvaal, capitalization £10,000. Property, the Farm Waterplaats, and a year's option, at £6,000, on the adjacent farms Lucasrust and Kopermijn, the 2 latter farms having an area of approximately 2,000 morgen. The mine had a 90' shaft, with several short drifts, at last accounts.

THARSIS SULPHUR & COPPER CO., LTD.

SPAIN

Office: 136 West George St., Glasgow, Scotland. Mine office: Alosno, Huelva, Spain. Works offices: Hebburn-on-Tyne, Durham, Eng.; Willing-

ton, Northumberland, Eng., and Cardiff, Glamorganshire, Wales. Lord Glenconner, chairman; Etienne M. Chalvet, Albert J. J. Messéan, Hugh Brown, Louis O. Schmidt, René Millet, Thos. Alexander, Jas. Couper and Wm. P. Rutherford, technical mgr., directors; Geo. Reid, sec.

Organized Oct. 27, 1866, under laws of Great Britain, capitalization £1,250,000, shares £2 par. Dividends, begun 1868, have been paid since, without the lapse of a single year, this dividend record being comparable, among copper mines, only with that of the Quincy Mining Co. of Michigan. The dividend disbursements have averaged 19% per annum since 1868, and, to the end of 1912, aggregated 868 1/6%, amounting to the magnificent total of £9,758,432, putting this company well to the front among the profitable mines of the entire globe. In addition to dividend disbursements, the company has written off sums aggregating £2,518,056, and on Dec 31, 1912, had £1,161,805 in cash and choice securities. Net profits of operations have ranged from a minimum of £27,052 in 1868, to a maximum of £478,878 in 1899, with £225,135 in 1905, £315,147 in 1906, £261,023 in 1907, £137,377 in 1908, £162,743 in 1909, £161,211 in 1910, £188,140 in 1911 and £253,066 in 1912.

Lands include the Tharsis group, 1,143 hectares, the Lagunazo group, 271 hectares, near Alosno, about 30 miles W. of the Rio Tinto mine, and the Calañas or Zarza group, 618 hectares, near Calañas, and midway between the Tharsis and Rio Tinto mines. The mines at Tharsis, worked by the Romans and probably by the Phœnicians before them, are identified by some with the Tarshis of the Bible. General geological conditions are much the same as at the Rio Tinto, the mines being in the southern zone of the Andevalo or Sierra Morena district of Huelva. The Tharsis group carries 4 main orebodies, having a generally S.-E. strike. The largest orebody is the Filon del Norte, at the N. E., having an extreme width of 140 meters and length of about 600 meters. The Filon de Sierra Bullones nearly adjoins the Filon del Norte, with a similar general trend, and the Filon del Centro, or Filon del Medio, is next in line, and is succeeded by the Criadero del Sur, the most southerly of the orebodies. The company also owns the Almagrera mine, about 1 mile S. E. of the center of the Tharsis group.

Systematic deep development of the Calañas mine, completed 1912, has developed between 6 and 7 million tons of copper-sulphur ore now being prepared for extraction. The depth of the orebody is still undetermined.

The North lode, unworked for many years, is being explored, 1913, as the ores, though low in copper, can be worked for sulphur.

The Lagunazo mine has not been a copper producer, except from old leach heaps, for some years, but shows a large quantity of ore rich in sulphur, though low in copper. There are large quantities of partially leached ore at the Lagunazo mine which continue to yield a fair quantity of cement copper.

The ore of all of the Tharsis mines is a massive cupriferous pyrite, formerly averaging about 3% copper, 50% sulphur and 45% iron, with very small quantities of gold, silver, lead, zinc, nickel, bismuth, antimony and arsenic, but with increased depth the copper percentage is decreasing. The mines, however, far from being exhausted, show enormous reserves of ore, low in copper, but of excellent sulphur tenor, and decidedly profitable, notwithstanding the decrease in copper values. In 1912, production was 33,480 long tons of ore from the Tharsis mines and 318,801 tons of ore, with removal of 169,727 cu. m. of overburden, from the Calañas mines, giving a total extraction for the year of 352,281 tons of ore, as compared with 327,348 tons of ore mined in 1911.

A part of the ore extracted is piled in heaps, from which the copper is

leached by systematic sprinkling, the leach water going to creosoted timber sluices, where the copper in solution is deposited on pig iron, and the precipitate sacked for smelting. Some of the older workings are flooded, and the mine water is pumped and leached for copper contents in the same manner as the leach heaps.

The company owns a private railway, of 4' gauge, an 18-mile branch connecting the mines at Calañías with the Tharsis group, and the main line of 29 miles runs from Tharsis to the port of Corrales, opposite Huelva, on the Río Odiel, where there is a shipping pier. The line is well equipped with rolling stock and is kept modern and efficient by frequent renewals.

The company owns extensive works at various points, including a wet process plant and refinery at Hebburn-on-Tyne, and other plants at Willington-on-Tyne, Cardiff, and Glasgow.

Owing to the declining copper tenor of its principal Spanish orebodies, the company has been endeavoring, for some years past, to secure new mines, in order to maintain its copper production, and to that end has investigated properties in many countries. The company held 2 contiguous properties at Mammoth, Pinal Co., Ariz., 1908-09, but abandoned same. Other properties are being investigated in Norway, but no new mines have as yet proven satisfactory. Production was 24,968,280 lbs. fine copper in 1898, 15,025,920 in 1902, 12,588,800 in 1904, 12,590,266 in 1905, 10,617,600 in 1906, 9,878,400 in 1907, 9,796,480 in 1908, 9,799,680 in 1909, 7,826,560 in 1910, 7,600,320 in 1911, and 7,564,480 lbs. in 1912. The record of this company is one of the very best ever made by any copper mine.

THELMA SYNDICATE, LTD.

NORWAY

Secretary and office: J. A. Stocker, 4 Broad St. Place, London, E. C., Eng. A. Dickinson, W. J. Payne, F. E. Elmore and J. A. Stocker, directors. Organized under laws of Great Britain, Oct. 22, 1910, capitalization £7,000, shares £1 par; all issued and fully paid. Debentures, £2,000 authorized, £1,450 issued.

Company is a private one in which the Ore Concentration Co., Ltd., is interested and was formed to treat the tailings and part of the crude ore of the Sulitelma and other copper properties in Norway, by the Elmore vacuum process. The payments are on a sliding scale dependent on amount of concentrate.

THOMAS; GEWERKSCHAFT DER GRUBE.

GERMANY

Mine office: Bergebersbach, Hessen-Nassau, Germany. Ludwig Heise, gen. mgr.; Eduard Speis, supt. Employs 15 men. Mine, in the development stage, has 2 tunnels, showing silver-lead, copper and zinc sulphides. No returns secured.

THORN'S FIND MINE.

QUEENSLAND

At Georgetown, 20 miles from Teasdale, on the Forsayth railroad, Queensland, Aus. J. H. Barnes, owner; Dan Thorn, discoverer and superintendent. Developed by a 10' pit, 1913, showing rich copper ore. A shipment to the Chillagoe smelter returned over £5 per ton, exclusive of all charges, including 45 miles teaming to Einasleigh.

TIERRA AMARILLA SMELTER.

CHILE

Owned by Sociedad Industrial de Atacama, Chile.

TINSJÖ KOBBERMINER; AKTIESELSKABET.

NORWAY

Idle. Office: Christiania, Norway. Mine office: Hovin, Telemarken, Christiansand, Norway. The mine has produced small quantities of ore assaying about 20% copper and 0.1% silver.

TINTO y SANTA ROSA; SOCIEDAD DE LAS MINAS

DE COBRE.

SPAIN

Office: 1 Rue Archimedes, Brussels, Belgium. Mine at Zalamea la Real,

Huelva, Spain. Capitalization 3,000,000 francs. Lands, 114 hectares, including El Tinto, Santa Rosa and 9 other old mines. Property includes a 7-kilometer aerial tram to Calañas, and has been under lease to the United Alkali Co., Ltd., for some years past.

TOCOPILLA; SOCIEDAD BENEFICIADORA DE. CHILE

Office: Valparaíso, Chile. Works office: Tocopilla, Antofagasta, Chile. Organized Sept. 7, 1906, under laws of Chile, capitalization £200,000, later reduced to £180,000, shares £1 par. Is controlled, through ownership of 80% of the issued stock, by H. D. Sloman. Company bought 1909, the mining properties of the Anglo-Chilian Nitrate & Railway Co., Ltd.

Lands, 520 hectares, near the port of Tocopilla, include the San Juan, Altamira, San Carlos, Feliciano, Colorado and Buena Vista mines, taken over from the Anglo-Chilian Co., also the Deseada, San José, Percance, Janequeo and Abandonada mines, all old properties, worked more or less in the past, and now in process of rehabilitation. Holdings and reduction plant fully described, Vol. X.

TOLAR DE COLLAHUASI; SINDICATO MINERO EL. CHILE

Is presumably the Chilean holding company for the Tarapaca Copper Quarries, Ltd., and property described under latter title.

TOLOSA; SOCIÉTÉ ANONYME MINES METALLIQUES DE. SPAIN

Probably dead. Office: Monceau les Mines, France. Mines at Leiza, Navarra, Spain. Capitalization 715,000 francs, 500 francs par. Property comprises lead-copper mines at Navarra, including the Regina, partially prospected.

TOLWONG MINERAL CO., LTD. NEW SOUTH WALES

Mine office: Bungonia, Argyle Co., N. S. W., Aus. Organized 1906, capitalization £6,000, shares 2s. par. Property, 250 acres, well timbered and watered, on the Shoalhaven river, carries an 11' vein, traceable 4,000'. This is opened by several shallow incline shafts developing stannite ore, said to average 10% copper, 8% tin, 15 to 30% arsenic and up to 3 oz. silver, with small quantities of zinc and lead and a trace of gold.

Equipment includes a 115-h. p. steam plant, with electric power and light. There are 2 aerial trams, 1 of 2,720' length, with elevation of 1,030' connecting the mine and smelter.

The smelter, built 1910, has a crushing plant and a reverberatory furnace, with electric power, and is planned to make tin-copper matte in 2 fusions. Property is decidedly interesting, but ore extremely difficult and costly to treat.

TORNERHJELM MINE. NORWAY

Owned by Sulitelma Aktiebolag.

TRAFALGAR MINE. QUEENSLAND

Owned by Mt. Elliott, Ltd. Developed by 2 shafts, 100' and 140' deep, 1913, sunk on well defined vein. Driving to connect these shafts has commenced. Ore averages 10% copper and mine considered very promising.

TREKELANO MINES. QUEENSLAND

Owned by Hampden Cloncurry Copper Mines, Ltd. Developed by 80' shaft, showing ore averaging 8 to 25% copper. A main shaft is being sunk to 250', management planning to develop on the 200' level. Equipment includes Cornish boiler and winding engine.

TRESAVEAN MINES, LTD. ENGLAND

Secretary and office: Aikman & Glen, 121 St. Vincent St., Glasgow, Scotland. E. S. King & Co., operators, Lanner, Cornwall. T. E. Lander, chairman; F. L. McLeod, R. T. Moore and J. M. Barbour, directors. Organized Jan., 1907, in Scotland, capitalization £150,000, shares 110,000 preferred and 40,000 ordinary, £1 par; issued 77,012 preferred and all ordinary.

Property is an old copper and tin mine that has been unwatered and systematically developed. The new work will be mainly on the Caddy's lode. It has a 3-ton steam hoist and the old 250-kw. generator is used to drive the compressor. Property examined and reported on by Dr. R. T. Moore and Capt. J. Paull, 1911.

TREUPEL; BERGWERK FR. D.**GERMANY**

Mine office: Herborn, Hessen-Nassau, Germany. Fr. D. Treupel, owner; Carl Treupel, supt. Lands, 70 claims, opened by shafts and tunnels, developing iron and copper ores.

TREVEDDOE MINING CO., LTD.**ENGLAND**

Office: 13 Throgmorton Ave., London, E. C., Eng. Col. Wm. F. Leese, chairman; R. Arthur Thomas, engr.; Wm. H. Adams, sec. Organized Aug. 13, 1900, under laws of Great Britain; capitalization £100,000, shares £5 par; issued £95,000. There are £10,000 of 5% debentures, and £7,500 of 5% prior lien bonds, authorized, with £6,100 issued, interest being several years in arrears.

Property, the Treveddoe tin and copper mine at Warleggan, Bodmin, Cornwall, 500 acres, held under a 100-year lease, subject to rental and royalty. Production was 60 tons of black tin and 175 tons of 7% copper ore in 1902. Operations for some years past have shown yearly losses, and the company seems likely to go into liquidation.

TSUBAKI MINE.**JAPAN**

Mine at Nishitate, Akita, Ugo, Japan. Kyosaku Takeda, owner and manager. Equipment includes steam installations aggregating 3,088 h. p. and 665 kw. electric power. Employed an average of 2,003 persons and produced 1,025,693 oz. silver, 532,852 lbs. copper and \$14,241 in gold in 1911 and 364,624 lbs. copper in 1912.

TUCO-CHEIRA; SOCIÉTÉ DES MINES DE.**PERU**

In liquidation. Office: 5 rue du Helder, Paris, France. Mine at Tuco-Cheira, Peru. A. Boscher, chairman; F. Maroni and P. d'Araujo, directors. Organized 1905, under laws of France, capitalization 3,750,000 francs, shares f250 par. Property, 2 groups, carrying copper and lead ores, and coal. Equipped with 75-ton matting furnace. Company will be reconstituted as soon as the railway to Recuay is finished.

TUMBY BAY COPPER MINING CO., N. L.**SOUTH AUSTRALIA**

Address: Tumby Bay, Flinders Co., S. A. Mine is 4 miles from the town and shows 2 veins, about one-half mile apart. The Tumby lode is reported to be 15" wide, trencched for one-fourth mile and proven to depth of 107', wholly in oxidized ore. The vein dips steeply S. and consists of quartz gangue with oxide and carbonate ores, malachite and azurite being most frequent. The Sack, a new shaft, 107' deep, was sunk in 1912. One shipment returned 11.20% copper. Property is an old one opened by several shallow shafts and trenches about 1867, when it was known as the Wheal Bessie mine.

TURNSTREAM COPPER MG. & DEV. CO.**CAPE PROVINCE**

Idle. Office: East London, Cape Province. Mine office: Cathcart, Cathcart Co., Cape Province. Organized June, 1907, capitalization £30,000, working capital £10,000, as successors of Turnstream Copper Syndicate. Lands, 16 miles from Cathcart, on the Zwart Kei river, have 4 veins, on 1 of which a 40' shaft has ore averaging 12.55% copper. No returns secured.

TWEETFONTEIN MINE.**CAPE PROVINCE**

Owned by Namaqua Copper Co., Ltd.

UGURCHAISKA MINE.**RUSSIA**

Office: Batum, Russia. Mine office: Zangezhur, Elizabetopol, Russia. Kunderov Bros., owners; G. Chaimazadi, mgr., at last accounts. Lands,

15 miles N. of the Arax river, which is the Russo-Persian boundary line, have a number of veins in diabase, frequently faulted and very erratic in occurrence, of 1 to 2 meters width, showing paystreaks of only about 8" average width, carrying covellite, bornite and chalcopyrite, latter predominating.

The mine has a shaft, but is developed mainly by winding, inclined tunnels having laterals and openings on the orebody with benched floors, the lower part serving as a sump, from which water formerly was carried to surface in leather buckets. Notwithstanding this archaic manner of development, the mine is opened to about 350' in depth.

The hydro-electric power plant has a turbine wheel, taking water through a canal from the Ochtchy Tschai river, with a generator giving a 500-volt current at 80 amperes. There is 1 electric hoist and an electric light plant.

The smelter employs preliminary heap roasting, after which ores are matted in 2 small water-jacket blast furnaces, burning charcoal and coke, brought from Evlach, with haulage charge of £5 per ton. Matte is collected in settlers and transferred to Manhes converters, turning out black copper, which is refined in reverberatories. Production was 350,000 lbs. fine copper in 1902, 450,000 lbs. in 1903, 650,000 lbs. in 1906, 700,000 lbs. in 1907, 435,000 lbs. in 1909. No recent returns secured.

UMKONDO MINE.

RHODESIA

Owned by South African Copper Trust, Ltd.

UNDALS VÆRKS NY INTERESSENTSKAB.

NORWAY

Office: Trondhjem, Norway. Mine and works office: Undal, Birkaaker, Norway. H. F. Klingenberg, pres.; A. H. Bachke, vice-pres.; Henry Banck, treas. Organized Aug. 28, 1888, as a reconstruction of a previous company, under laws of Norway, capitalization of 97,200 kroner, shares 400 kroner par, fully paid.

The mine, discovered A. D. 1650, has been opened on several occasions, and worked on a small scale. The ore is slightly cupriferous pyrite, low in copper tenor, and carrying about 44% sulphur. The mine has been idle some years, awaiting the advent of a railway, and the management plans beginning shipments 1916, when the railway will be completed to the property.

UNDERLAY MINE.

NEW SOUTH WALES

Idle. Mine office: Dandaloo, Narramine Co., N. S. W., Aus. J. Dunwell, owner and manager. The mine, discovered 1903, adjoining the Mount Royal mine, in Kennedy county, about 16 miles N. W. of Dandaloo, has a 5' vein, carrying silicious oxidized and sulphide copper ores, ranging up to 40%, developed by shafts of 150' and 200'.

UNION CONS. COPPER MINES (1911), LTD. SOUTH AUSTRALIA

Local offices: 75 King William St., Adelaide, S. A. Secretary and office: H. F. Spiers, 190 Dashwood House, London, E. C., Eng. Mine at Umberatana, Lyndhurst, S. A. T. Haydon, A. Goddard, J. Calder, H. Greenhalgh and F. Taylor, directors. Organized Sept., 1911, as successor of the Union Consolidated Copper Mines, N. L., and the Lyndhurst (South Australia) Copper Co., Ltd. Capitalization £150,000, shares 5s. par.

Property, 680 acres, at Umberatana, about 70 miles from Lyndhurst station, includes the Daly and Lyndhurst mines. The Daly property shows a great reef of quartzite, forming the crest of a N. W.-S. E. ridge, for one-fourth mile, that is stained with copper ore. This mass of shattered quartzite shows argillaceous seams with concentrations of high-grade ore, but not enough development had been done at last report to determine its actual value or to warrant the large ore reserves claimed by company.

The Daly mine has numerous shallow shafts, the deepest apparently but 250'. The company has claimed a width of 400' for the vein and a length of 1½ miles, but according to report, it shows but 10 to 20' of workable width in which impregnations of carbonate ore in tiny specks average 4 to 6% copper with small gold values. Company claims 7 veins and reports that the reserves blocked out in these veins average 13% copper. The Lyndhurst lode is said to carry 3% ore. In 1912 the company was working the mine on a modest scale, but not producing ore.

The smelter at the mine has a 100-ton water-jacket blast furnace, installed in 1910. Management estimates 2,000,000 tons of ore blocked out.

UNION MINIERE DU HAUT-KATANGA. BELGIAN CONGO

Office: 7 Montagne du Parc, Brussels, Belgium. Works at Elizabethville, Katanga, Belgian Congo. Baron F. Baeyens, chairman; Robt Williams, vice-chairman; Baron de Moor, managing director; H. Buttgenbach; J. Jadot, J. Cornet, Lord Arthur Butler, Tyndale White, Sheffield Neave and C. F. Rowsell, directors; Geo. Velge, sec.

Organized Oct. 28, 1906, under laws of Congo Free State, capitalization £400,000, shares £4 par; increased May 10, 1912, to £500,000, by issue of 25,000 new shares, fully paid. There are also 125,000 dividend shares without nominal value. Debentures, £800,000 authorized, at 4½%; issued £600,000. Is controlled, through half ownership each, by Tanganyika Concessions, Ltd., and Société Générale de Belgique. Annual meeting, first Monday in December.

Lands are very extensive, the concession comprising a copper belt about 200 miles long containing upwards of 100 exposures of copper and a tin belt nearly 100 miles long N. of the Kafue and Zambesi rivers, in the southern part of the Katanga, a rolling country with a fairly healthy climate. Company also owns valuable water power rights. The copper properties show sandstone carrying malachite impregnations. Company reports having prospected 10 mines sufficiently to warrant an estimate of 10,000,000 tons of 10% copper ore in sight and, in the tin belt, claims to have developed a large tonnage of 1% cassiterite ore.

The Star of the Congo mine was estimated, June, 1913, to have ore reserves of 1,300,000 tons averaging 5% copper, above water level. Development work below this level is in progress.

The Kambove No. 2 mine has 2 shafts, "H" and "I," which, at last accounts, were about 100' each in depth, but probably have been deepened, and crosscuts were said to prove an orebody of 200' width. This mine was estimated, June, 1908, to carry 9,000,000 long tons of ore, with 3,000,000 long tons in sight, averaging 12% copper. This estimate, on the strength of very limited and rather amateurish development, is considered grossly inflated.

In addition to copper properties, the company owns promising tin mines, these including the Busanga mine, which has payable stream-tin deposits, in alluvium of 3 to 10' thickness, estimated to show 3,000 tons of tin. The Kasonso and Chienzi mines have lode-tin deposits but apparently are but slightly developed.

The company also owns the Ruwe gold mine, which has an orebody of 9 to 14' width, opened for a quarter mile by several shallow drifts, deepest only 100', vein being a sandstone reef carrying gold up to 9 oz. 7 dwts. per long ton, and claimed to average 5 dwts. gold and 9 dwts. platinum, with occasional palladium, gold being quite coarse. The platinum figures seem to lack substantiation. The Ruwe mine also has a placer deposit, estimated to carry 20 oz. gold per long ton, from which some production was secured, at an average claimed cost of only 12s. per ton. Apparently the Ruwe

placer is nearly or quite worked out. The mine is credited with a production of 650 kgs. gold, but is idle at present for lack of transportation facilities.

In addition to ores of copper, tin, and gold, and claimed deposits of platinum and palladium, the company has an iron ore deposit, apparently of promise, near Shamerenga, on the Lualaba river, and a coal seam which is said to have been prospected to depth of about 300'.

The Lubumbashi smelter, 10 miles from the Star mine, has a 200-ton blast furnace, making ingot copper of about 95% purity and a second furnace is being installed which will be in commission by 1914. A briquetting plant, of 250 tons daily capacity, was added 1913, and a Coppee coking oven of 3,000 tons capacity, was being installed. Utilization of electrical power in smelting operations is under consideration.

Like its relative, the Tanganyika Concessions, Ltd., much misinformation has appeared in the press regarding the property, and the statements have been uniformly exaggerated.

The company does possess valuable mining properties, but investors are cautioned to secure information direct from the company officials and not to place reliance on current newspaper and magazine reports. See account of Tanganyika Concessions, Ltd., in this book and in Vol. X.

UNITED AFRICAN EXPLORATIONS, LTD.

ENGLAND

Secretary and office: Mack & Palmer, 1 Broad St. Avenue, London, E. C., England. Owns shares in Esperanza Copper & Sulphur Co., Huelva, Spain, and in various rubber, gold and oil companies elsewhere.

UNITED ALKALI CO., LTD.

SPAIN

Office: 30 James St., Liverpool, Eng. Mine office: Valverde del Camino, Huelva, Spain. Works office: St. Helens, Lancashire, Eng. John Brock, chairman; E. K. Muspratt, vice-chairman; Eustace Carey, sec.; J. H. Cresswell, gen. mgr.; C. Kaesmacher, asst. mgr.; Alex. Hill & Stewart, cons. engrs. Organized under laws of Great Britain. capitalization £8,750,000. Net earnings were £362,244 in 1908, from which £133,746 was disbursed for interest on debentures.

The company is primarily a chemical and manufacturing corporation, copper mining being merely a small branch of its business, which embraces 46 subsidiary works and corporations, some of the plants of very great size. The company has its principal works at St. Helens, Runcorn, Flint, Widnes and Glasgow, making extensive use of Spanish and Portuguese pyrites, which are burned for sulphur, after which the cinder remaining is leached for copper.

The company's copper properties in Spain include the Sotiel Coronada mines; also the Castillo del Buitron mines, held under lease from the Compañía del Ferrocarril y Minas del Buitron; the Cabezas del Pasto mines, held under lease from the Sociedad Colectiva C. y J. Sundheim, and Tinto and Santa Rosa mines, all in the province of Huelva. The Monte Rubio group was abandoned, 1909. These properties show typical Huelvan slates, carrying lenticular contact deposits between slate and porphyry, having a generally N.-W. strike, with dip from 30° to vertical, carrying cupriferous pyrite.

The Sotiel Coronada mine, 666 hectares, produces cupriferous pyrite ores and cement copper equivalent to an annual output of about 1,000,000 lbs. fine copper.

The Cabezas del Pasto group of 6 mining concessions, 104 hectares, includes also 300 hectares of adjoining lands, having lenticular orebodies, apparently increasing in size with depth, opened by 12 shafts, deepest 104 meters, with 6,000 meters of workings 1908, estimated to show 750,000 tons of fully developed pyritic ore, and 1,500,000 tons of cupriferous schists.

Extraction is underground, which is said to be both safer and cheaper than opencast operations, and mining is by overhand stoping, with dry walling and rock filling for depleted stopes. The Cabezas del Pasto ores carry 1.5 to 5% copper and 40 to 52% sulphur. The cupriferous schists range from 0.25 to 30% copper tenor. All pyritic ore above 1.5% copper, and all schists better than 10% in copper tenor, are exported, the low-grade ores being leached at the mine, and washed sulphur ore exported. The mine water carries up to 9 kgs. copper per cubic meter and is leached, the cement copper being washed and classified, the best quality averaging 98.5% copper, which is the highest grade precipitate produced anywhere. The surface plant of the Cabezas del Pasto includes a Robey hoist and pump, and the mine is served by a tramline of 36-cm. gauge, connecting with the company's private line, also by an aerial tram leading to wharves at La Laja, on the Rio Guadiana.

The Castillo del Buitron property is a group of 4 concessions, 47 acres, at Zalamea La Real, and includes La Poderosa group of 6 hectares, adjoining, and the Concepción mine of 6 hectares, at Almonáster. The Castillo del Buitron group has 2 principal lenses of ore, these being the Levante, with a length of 150 meters, but of decidedly irregular outline, and the Poniente, about 200 meters long. Production of this group averages 1,500,000 lbs. fine copper yearly.

The Tinto & Santa Rosa group includes La Santa Rosa and El Tinto mines, having a combined area of 141 hectares, at Zalamea La Real, leased from the Sociedad de las Minas de Cobre Tinto y Santa Rosa. The Santa Rosa mine has 2 parallel lenses, with 7 levels opened, and the Tinto mine has ores said to average about 1.5% copper and 46% sulphur. The group has 9 shafts, and was estimated 1908, by the Spanish government, to have 1,500,000 metric tons of ore developed. Production from this group was 38,005 long tons of pyrite and 803 long tons of cement copper 1905, and 58,181 metric tons of ore in 1908, and present production is estimated at about 2,000,000 lbs. fine copper yearly. These properties have a 9-kilometer Bleichert aerial tram to Calañas.

The company controls the Ferrocarril del Buitron of 42" gauge, of 79 kilometers length, running from Castillo del Buitron to Huelva, equipped with 18 locomotives. The company was said, 1908, to have projected an extension of the line to La Rábida.

Production from Spanish mines was 103,225 metric tons of cupriferous pyrite, 41,247 tons of pyrite and 1,258 tons of copper precipitate, 1908. The company formerly was a large purchaser of iron pyrites, but now supplies its own requirements, in the main. Production is estimated at 6,000,000 lbs. fine copper, 1913.

UNITED MINES OF UPPER KATANGA.

BELGIAN CONGO

Owned by Union Minière du Haut-Katanga, (which see).

UNITED PEAK DOWNS COPPER & COAL CO., LTD. QUEENSLAND

Office: Edwards St., Brisbane, Queensland, Aus. Mine office: Copperfield, Clermont Co., Queensland, Aus. John Currie, chairman; Currie, Buchanan & Co., secs.; J. T. Coates, mine mgr.; W. H. Rands, cons. engr. Organized 1908, under laws of Queensland, capitalization £75,000, shares 7s. 6d. par; issued, 130,000 shares, 4s. 6d. paid up. Company was a reconstruction of the Peak Downs Freehold Copper & Coal Co., Ltd., which was a reconstruction of the Peak Downs Copper Co.

Property is the old Peak Downs mine, 37 acres freehold, which, in early days, carted ore about 300 miles, securing profits therefrom of £278,250, in 15 years' operation. The mine, reopened 1906, by predecessors of the present company, has a vein of 2 to 3' average width carrying shoots of high-

grade ore, in 3 narrow parallel veins of 6 to 20" width, ore as a whole averaging about 4.5% copper. The mine, opened to depth of 270', has been thoroughly retimbered and when reopened old pumps and pipes were found converted into copper precipitate by the action of the acid mine waters.

The smelter, built some years ago, has reverberatory furnaces and a new 100-ton water-jacket blast furnace was blown in, July, 1907, working intermittently until Oct., 1907, when smelting was suspended. Mine considered promising, but will require extensive development, its high-grade ore having been picked out by the old management. Idle since Oct., 1907.

URETA é HIJOS; IGNACIO SILVA.

CHILE

Works office: La Ligua, Aconcagua, Chile. This firm owns the Ali-cahue smelter, 22 miles (37 km.) from La Ligua, with a carriage charge therefrom of 8 pesos per metric ton. The smelter has a Harnecker 36" circular water-jacket blast furnace, doing matting only, and smelting ore mainly from the Farellón mine. Slags average 0.5 to 0.75% copper. Operations are controlled by the high price of coke, which costs 100 pesos per metric ton, delivered, and boilers are stoked with wood.

VALDIVIA; FUNDICION DE.

CHILE

Owned by Compañía Minera de Combarbalá.

VALENCIANO-ANDALUZA DE ALTO HORNOS y MINAS DE PEÑAFLORES; SOCIEDAD.

SPAIN

Office: Glorieta, 1, Valencia, Spain. Mine office: Peñaflores, Sevilla, Spain. Don Baldomero Deu, president and agent. Capitalization, 150,000 pesetas, shares 250 pesetas par. Property is the Elvira mine and extensions, carrying copper and iron pyrites, at Peñaflores, and a group of claims, 144 hectares, at Pueblo de los Infantes, Sevilla. Idle.

VALIEVO (SERBIE); SOC. ANON. FRANÇAISE

DES MINES DE CUIVRE DE.

SERBIA

Office: 13 Rue Rougemont, Paris, France. Mine address: Rebelj, Valievo, Servia. M. Ducos, pres.; A. Bevelley, vice-pres. Organized Jan. 10, 1901, under laws of France, capitalization 2,000,000 francs, shares 100 francs par. Debentures, 50,000 francs, at 6%, in bonds of 100 francs par. Idle.

VALPELLINA; SOC. MINIERE ET FONDERIE DI.

ITALY

Office: Genes, France. Mine office: Ollomont, Torino, Italy. Owns the Preslohg mine.

VENTURE TRUST, LTD.

NORWAY

Secretary and office: E. Fairweather, 5 Moorgate St., London, E. C., Eng. Col. Sir. H. Melliss, chairman, E. L. Heinemann and H. E. Middleton, directors. Organized Jan. 1, 1913, as a reconstruction of the London Venture Corp., Ltd., capitalization £250,000, shares 4s. par; issued, 1,224,516 shares.

Property is the Birtavarre copper mine, in Norway, and sundry share holdings, the company being primarily an investment and securities holding corporation, with large interests in the Hay Gold Mining Co., Harmony Proprietary, Mexican Mining & Industrial Corporation, Jequie Rubber, West Jequie and Crude Rubber Washing companies.

Owned by Nijni-Tagilsk Mines & Works at Nijni Tagilsk, Perm, Russia.

VICUÑA; FELIX.**CHILE**

Office and mine: Higuera, La Serena, Coquimbo, Chile. Property includes 5 mines and a smelter. La Champeta, the principal mine, is the deepest in the district, developing a number of parallel veins, the main vein of 5 to 7' width, dipping at 60 to 80°. An oxidized zone, of about 230' depth, is followed by rich secondary sulphides, succeeded by chalcopyrite ore averaging 10 to 15% copper, presumably after selection.

La Cortada and San Francisco mines, 3 hectares, are opened to a depth of 492' and of a horizontal length of 460', the working developing 2 main veins, of 3 to 5' average width, and a large number of secondary veins, walls being much broken, the mine being almost a stockwerk. The ores average about 5% in copper tenor only, rendering them unavailable for present use, though of future promise.

The San Ramon mine, opened 1851, is 885' deep, with a vein of about 4' average width, carrying low-grade ores. The Panchita mine, opened 1850, is 1,148' deep. La Solitaria mine, opened 1893, is slightly developed to 496' depth.

The smelter, at Higuera, 18 kilometers from Totoralillo, the nearest rail point, has 3 small reverberatory furnaces, producing matte of about 50% average copper tenor, sent to El Astillero works, at Huasco, for conversion.

Production has shown a considerable diminution in the past decade, having been 1,613,262 lbs. fine copper in 1903, 856,286 lbs. in 1906, 215,936 lbs. in 1908, and only 43,091 lbs. in 1909. No recent returns secured.

VICUÑA; SANTIAGO.**CHILE**

Office and works: Huasco, Freirina, Atacama, Chile. Property includes a mine, which is said to be nearly worked out, and 2 smelting plants. El Astillero works, at Huasco, include a mill having a crusher and stamps, and a smelter with 6 three-deck calcining furnaces and 3 reverberatory furnaces. El Ijirio smelter, at Morada, 27 kilometers from Sarco, the nearest rail station, has 2 reverberatory furnaces, producing matte of about 50% average copper tenor, shipped to El Astillero works for conversion. Carriage charges to the railway are 6 pesos per metric ton, and fuel is imported coke, costing 27 pesos per metric ton. Owners plan reconstructing and modernizing this plant in near future.

VIJSKI WORKS**RUSSIA**

Owned by Nijni-Tagilsk Mines & Works.

VIVIAN MINE.**QUEENSLAND**

Mine address: Cloncurry, Beaconsfield Co., Queensland, Aus. Messrs. Brady, Trainer & Sharpe, owners. Property, about 3 miles N. of the junction of Florence and Granite Creeks, is developed by 2 shafts of 50 to 22', showing highly silicious ores carrying about 8% copper, found in very narrow veins, with occasional gold values up to \$7 per ton.

VIVIAN & SONS.**WALES**

Office and works: Swansea, Glamorganshire, Wales. This firm, of which the late Lord Swansea was the head, is one of the oldest metallurgical enterprises in Wales. The Hafod works, at Swansea, dating from 1810, include smelters for the treatment of gold, silver, lead, copper, zinc and complex ores, and a small electrolytic refinery. There are a number of manufacturing plants, including rolling mills for copper plates and sheets; lead works for the manufacture of pig and bar lead, and lead pipes, rods and sheets; spelter works for making zinc plates; bluestone works for the manufacture of copper sulphate; sulphuric acid works, and fertilizer works utilizing the acid. The firm also owns the Margam works, at Port Talbot, near Swansea, with rolling mills making copper, brass and yellow metal sheets, tubes and other finished products, and owns collieries in Wales.

VLADIVOSTOCK DE COLLAHUASI; COMPAÑIA MINERA. CHILE

Office: Iquique, Chile. Mine office: Collahuasi, Tarapacá, Chile. Organized March 31, 1906, under laws of Chile, capitalization 640,000 pesos, shares 16 pesos par. No record of operations securable.

VOLCAN SMELTER.**CHILE**

Owned by Compañía Minera de Maipó, at El Volcan, Chile.

WALLAROO & MOONTA MG. & SM. CO., LTD. SOUTH AUSTRALIA

Office: Steamship Bldgs., Currie St., Adelaide, S. A. Mine offices: Wallaroo Mines, Kadina, S. A., and Moonta, S. A. Operating and works office: Port Wallaroo, S. A. Jas. Harvey, chairman; Sir Lancelot Stirling, Sir J. J. Duncan, J. R. Corpe and Simpson Newland, directors; David Davidson, sec.; H. Lipson Hancock, gen. mgr.; Jas. Pryor, asst. gen. mgr.; David H. Ladd, smelter supt. Union Bank of Australia, Ltd., Australia, bankers; Elder Smith & Co., Ltd., London agts.

Organized 1899, under laws of South Australia, as a merger of the Moonta and Wallaroo companies, capitalization £400,000, shares £2 par; issued, £320,000. To end of 1912 the company paid 44 dividends, aggregating £563,000 dividends having been £80,000 in 1906, £140,000 in 1907, £24,000 in 1909, £16,000 in 1910, £8,000 in 1911, and £60,000 in 1912. The Wallaroo Co., previous to the merger, produced copper to the value of £2,229,096, paying dividends of £430,254 therefrom, and the Moonta Co., preceding the merger, made copper to the value of £5,396,146, paying dividends of £1,168,000 therefrom, giving the property a total dividend record to Sept. 30, 1912, of £2,161,254, from about 50 years of operation. Net profits were £35,534 in 1909, £21,824 in 1910, £37,057 in 1911, £88,438 in 1912. Balance of assets Dec. 31, 1912, were £165,887.

Lands are extensive, including the Wallaroo and Moonta groups, about 10 miles apart, with various smaller properties, besides the site of the reduction plant at Port Wallaroo, all in Yorke's peninsula, on Spencer gulf. The Wallaroo mine was discovered 1860, and the Moonta 1861, and both mines have been operated, practically continuously, since 1863.

The Wallaroo group of mines, 6 miles E. of Port Wallaroo, includes the Kurilla, an adjoining property, about 1,500 acres in all. The property shows metamorphic mica-schist of Cambrian or pre-Cambrian age, carrying 6 nearly parallel N. W.-S. E. veins with varying dip. The veins are 6 to 33' thick, and connected by cross veins. These veins are traceable as lines of altered schist for nearly 2 miles, and are opened to about 2,500', but most of them pinching out with depth. On the 2,000' level, the payshoot is about 3,000' long with 600' further of mineralized vein matter that does not pay for extraction, but will be available for treatment later. Good values are maintained in the deepest workings. The gossan showed atacamite and copper carbonates, succeeded by a leached zone of 35 to 40' depth, followed by native copper, cuprite, melaconite, azurite and malachite, but these oxidized ores were worked out many years ago. At depth the ore carries chalcopyrite, associated with pyrite, hematite and occasional molybdenite in a quartz, calcspar, schist gangue. Copper occurs as chalcopyrite, the ore varying from 3 to 4% copper as mined, but concentrated about 4 into 1 for the smelter. Ore is mined by overhand stoping and wide workings are stilled and filled with waste, the drifts alone being kept open. The Wallaroo and Kurilla mines, jointly, have been opened by a number of shafts, mainly inclined on the veins, with 35 miles of workings, many of the shafts being old and abandoned. The principal shafts are Taylor's, Young's, Office, Boor's and Elder's, the first 3 used for hoisting, having 4-ton skips. New work for 1912 aggregated 2,847'.

Taylor's shaft, 2,472' deep, is the principal opening of the mine. The

old shaft was badly injured by fire 1904, and was replaced by a new vertical shaft from surface, connecting at depth of 840' with the old workings. Extensive storage bins have been installed between the various levels in this shaft. All mine water below the 750' level is handled by electric pumps.

Young's shaft, 2,145', Office shaft, 1,976', and the Boor's shaft, 1,595' deep, are the main openings. The Wallaroo mine, has an inflow of about 250,000 gals. of water daily, handled by a pumping installation with stations on the 750', 1,230', 1,830' and 2,430' levels, equipped with Worthington vertical 3-throw plunger pumps, driven by direct-connected constant speed 3-phase motors. An emergency pumping plant has stations on the 1,230' and 1,830' levels, with Worthington vertical 3-throw pumps, coupled to 60-h. p. 3-phase variable-speed motors by double spur gearing, these pumps starting and stopping automatically, under control of float attachments in the sumps that actuate a liquid starter.

The Kurilla mine, practically a part of the Wallaroo, is opened to a depth of 1,170', on a vein parallel to the main vein of the Wallaroo which has an orebody of 10 to 12' width that is lumpy, but has high-grade shoots averaging about 11% copper after sorting. Work was discontinued in the Kurilla mine, 1910.

The Moonta group includes the Moonta, Moonta Central and North Yelta mines, formerly 2,700 acres, held by leasehold from the Crown, but 950 acres, considered unprofitable, were surrendered in 1911. The country rock is an intensely hard, dense felsite porphyry, covered by silicious limestone holding 15% silica which weathers in rounded masses. The Moonta mine has 5 main and 22 lesser veins which vary from 6 to 30' wide. The main veins are fairly parallel, running N. E. but with numerous stringers and cross fissures. The orebodies are regular, and show quartz streaks on the footwall. Atacamite was found in the upper workings underlaid by a barren zone, 60 to 125' deep, below which small quantities of oxidized ores were found, lying on sulphide ores consisting of chalcopyrite, a little bornite and pyrite in a quartz gangue. The chalcopyrite also occurs in the country rock, particularly in cross fractures and cleavage planes. For many years, the Moonta ores averaged 20% copper after hand sorting, but the present output averages 3% copper for the crude ore.

The Moonta mine has been opened to a depth of 2,500' but shows very little ore below 2,000', most of the veins being worked out and ore reserves at the end of 1912 were only about 40,000 tons of 2 to 4% copper ore. The Moonta is an old mine and has many old shafts, mostly vertical for a short distance and then inclined following the dip of the vein. The main workings connect with Taylor's shaft, 2,570' deep, and development for the entire mine aggregates over 40 miles. New development for 1912 totalled 1,912', and 21,154 tons of granulated slag and about 10,000 of Parametta tailings were used for slope filling.

The Moonta Central mine was unwatered to the 180 fathom level in 1907 and a little fluxing ore mined until April, 1908. The North Yelta mine has been idle since 1907.

The central power plant at Wallaroo, enlarged 1907, effected a great saving in operating costs over the numerous small isolated installations of machinery. The poor quality of Beetaloo water has been overcome by the installation of condensers. Buildings include several shops and engine houses with large changing houses at the principal shafts.

The government railway line connects both the Wallaroo and Moonta mines with the reduction plant at Port Wallaroo. There are concentrators at both mines and the process followed at each is essentially the same. The ore is dumped from mine skips on grizzlies, passing to bins and carried

to the concentrators by railway cars. At the mills, the ore is crushed and goes to revolving trommels, from which oversize is sorted and selected by hand from traveling belts, with suitable bin arrangements. Concentrating ores, after passing half-inch mesh, are treated by Hancock jigs, the largest jigs at the Moonta mine, treating 25 to 30 tons of material hourly. The well-known Hancock jig, now in use throughout the world, was designed by the late H. R. Hancock, former general manager of this property, for the use of these mines. About 12 to 15% of the material is slimed, slimes going to spitzkasten for classification and distribution to vanners and round tables, which yield a product of 10% copper tenor.

At the Moonta mines coarse material and tailings from the wash are piled in heaps, weathered and leached. Heaps range 20 to 60' in height, the tops of the piles of coarser material being laid out in terraces. Ore heaps are systematically sprayed and the leach liquor, carrying 30 to 70 grains of copper per gallon, runs to vats. The leach heaps cover about 30 acres and contain about 1,250,000 tons of tailings, which require a considerable length of time for complete oxidation and thorough leaching. This company has purchased the tailings and slimes of the Paramatta Copper Mines, Ltd., for treatment.

Fine wastes and slimes are treated in a leaching plant where they pass through a series of vats containing leach liquor to which 12 to 20 lbs. of sulphuric acid are added for each ton of slimes treated. The slimes are agitated in the vat by revolving arms, the pulp, after agitation, passing to settling dams and clarifying reservoirs. The leach liquor is drawn off in earthen pipes to the main precipitating works, where it joins the liquor from the various tailings heaps, and copper is precipitated therefrom on scrap iron. The material from the settling dams is weathered and given a second and occasionally a third leaching. The average production of cement copper from these plants is 500 long tons yearly. Flotation plants, employing the patented process of the Minerals Separation Co., were installed 1912, with excellent results, the extraction of copper from crude ores running up to 95%.

The smelter, at Port Wallaroo, 7 and 10 miles distant from the Wallaroo and Moonta mines, respectively, does some custom work in addition to treating the company's ores.

In 1912, 65,920 tons of ore and precipitate were treated, and output of the smelter was 6,287 tons refined copper, 1,223 tons electrolytic copper, 102 tons bluestone, 1,757 oz. gold and 2,045 oz. silver.

The smelter has 2 blast furnaces, rebuilt 1907, and 4 refining furnaces. No. 2 furnace has been equipped with water jackets of mild steel plate, replacing cast-iron jackets. There are sintering pots for treating flue dust and fines. Slags are granulated and sent back to the mines for underground filling, this being the first property to make such use of slag.

The converter plant, installed 1910, is in a steel shed having a 50-ton Babcock & Wilcox electric crane, of 47' span. There are 2 Allis-Chalmers stands, operated electrically, with 5 shells, which are lined by an Ingersoll-Rand tamping machine, mounted on a jib crane. The company also has a small electrolytic refinery, and the final product is a copper of exceptional purity, sold through Aron Hirsch & Sohn.

The smelter power plant has steam and electric power, with a Belliss & Morcom engine, and there are 4 Samuelson blowers for furnace blast, the converters being supplied by a Fraser & Chalmers blowing engine and a Reavell air compressor. Coal is handled by a large electric gantry.

The company's private railway system connects the various mines with

the works, the line reaching all important shafts and shops, including many miles of railway, and there are 12 locomotives.

The acid works and bluestone plant, latter rebuilt 1907, are at the smelter, utilizing fumes from the burners, and considerable commercial acid is sold to a fertilizer company manufacturing superphosphate. Production of acid was 5,095 tons in 1912 and plant was idle 7 weeks. Bluestone, manufactured in connection with the acid plant, amounted to 102 tons in 1912.

Production, to Dec. 31, 1904, by this company, was copper valued at £4,281,342, and total value of production of the mines to that date was £12,245,554. Recent production has been as follows:

Year.	Lbs. copper.	Oz. silver.	Oz. gold.
1904	13,070,252	(not reported.)	
1905	14,563,097	(not reported.)	
1906	16,936,640	8,250	2,326
1907	19,314,480	5,845	2,009
1908	14,443,520	7,416	1,950
1909	11,860,800	4,995	1,819
1910	10,875,200	2,011	1,296
1911	13,616,960	1,400	1,222
1912	14,006,380	2,045	1,757
1913 (6 months)	7,023,520	(not reported.)	

The cost of finished copper was £72 11s. per long ton, equal to 15.7 cts. per lb., in 1906, and cost of copper f. o. b. ocean steamers, was £53 3s. 11d. per long ton, in 1909; £54 11s. 2d. per long ton in 1910; £51 5s. 5d. per ton, equal to 11.15 cts per lb. in 1911; £60 12s. per ton, or about 13 cts. per lb., in 1912. The mines are rapidly nearing exhaustion, but the management is thoroughly competent and progressive.

WALTER'S COPPER MINE.

SOUTH AUSTRALIA

Mine office: Beltana, So. Aus. Property, 5 miles S. of Beltana, is developed by a 20' shaft and opencuts, showing a wide vein of altered clay-slate impregnated with flakes and nodules of malachite and azurite and said to have given assays of 8.2% and 4.5% copper. Idle.

WARRA DIVIDEND CO., LTD.

SOUTH AUSTRALIA

Liquidated, 1912. Formerly at Hergott Springs, So. Aus. See Vol. X. **WARRA WARRA MINE.**

SOUTH AUSTRALIA

Mine address: Hergott Springs, So. Aus. Property comprises 160 acres showing alternating beds of kaolinized and indurated slates, sandstone and quartzite, carrying native copper in fine particles, cuprite, malachite, chalcocite and chalcopyrite. The main orebody is reported to average 50' in width, traceable 1 mile, carrying ore assaying 3 to 8% copper, hand-cobbed to an average tenor of 36% for shipment. Development is by vertical shafts of 60', 65', 80', 108' and 266', and by tunnels of 80', 110' and 160'.

The property was under development at various times by the Tasmanian Copper Co., Ltd., and Warra Dividend Co., Ltd., and in each instance abandoned for want of working capital.

WARROO GOLD & COPPER MINES, N. L.

QUEENSLAND

Office: Hoskin's Bldg., Spring St., Sydney, N. S. W., Aus. Mine office: Stanthorpe, Bentinck Co., Queensland, Aus. W. A. Benn, chairman; A. J. Dixon and E. M. Mitchell, directors; J. C. Benn, sec.; Selwyn R. Mort, mgr., at last accounts. Organized Aug. 18, 1909, under laws of New South Wales, as successor of Warroo Gold & Copper Co., N. L., capitalization £20,000, shares 10s. par. Has authorized a bond issue of £2,500.

Lands, 50 acres, held by mineral lease from the government, on tracts of 10 and 40 acres, latter having a 3' vein of pyritic quartz, carrying a little gold. Development includes a 200' main shaft, the upper levels showing

mainly gold values, and the 200', or bottom level, showing mainly copper values, with frequent assays of 10 to 12% copper. The mine was estimated to have 3,000 to 4,000 long tons of gold ore, developed 1911, averaging 55s. gold per ton, and 2,500 long tons of auriferous copper ore, estimated at 112s. value per ton. The 10-acre lease has a 110' shaft, showing a 3 to 4' vein, carrying ore assaying 8% copper and 1 oz. 6 dwts. gold per long ton.

Equipment includes a steam plant, with a double-cylinder hoist, and buildings include a smithy and changing house.

The smelter was blown in late Oct., 1910, but suspended shortly for repairs. The plant has a McMurtry sintering pot, replacing heap roasting.

The mine was being worked by tributors, for its gold ores alone, at last reports.

WEST AUSTRALIAN MINING CO., LTD.

VICTORIA

Was organized under laws of Great Britain Nov. 10, 1892, as the Victoria Copper Co., later changing name to present title, and after several more reorganizations is now known as the African & Australian Co., Ltd. (which see).

WEST BRITISH DEVELOPMENT SYNDICATE, LTD.

IRELAND

Office: 709 Tower Bldgs., Liverpool, Eng. Mine office: Crookhaven, County Cork, Ireland. Thos. L. Miller, liquidator; T. Holmes, mine mgr. Organized Aug. 16, 1905, under laws of Great Britain, capitalization £31,500, in £30,000 of 6% cumulative preference shares of £1 par, and 30,000 deferred shares of 1s. par. Property is the Browhead mine, at Crookhaven, carrying copper and lead ores, and leasehold lands at Berehaven, which are for sale.

WEST BURRA COPPER MINE.

SOUTH AUSTRALIA

Mine address: Burra Burra, So. Aus. The property, 3½ miles S. W. of the Burra Burra mine, shows a large deposit formation of ferruginous calcite carrying several narrow veins of copper carbonate ores. A 4" seam of malachite and small amounts of chalcocite are also noted at comparatively shallow depth. Development is by several pits, and shaft 30' deep, at last accounts.

WEST CARBERY COPPER ESTATES, LTD.

IRELAND

Office: 10 Bush Lane, London, E. C., Eng. Mine office: West Carbery, County Cork, Ireland. A. S. Caldwell and Dr. A. Drysdale, directors; A. Collins, sec. Organized 1908, under laws of Great Britain, capitalization £52,000, in £50,000 "A" shares of £1 par, and £40,000 "B" shares of 1s. par; issued, £2,402 "A" shares, fully paid. The mining properties, held by leasehold, are located at Ballycummisk, Foilnamuck, Rossbrin, Cappaghna-callee and Cappahglass, all in the Barony of West Carbery. No returns secured.

WEST MOUNT LYELL, LTD.

TASMANIA

Office: 20 Bucklersbury, London, E. C., Eng. Operating office: Hobart, Tasmania. Mine office: Gormanston, Montagu Co., Tasmania. R. E. Tyler, chairman; J. H. Wolf and J. E. Franck, directors; W. H. Bustard, sec., at last accounts. Organized Oct. 2, 1907, under laws of Great Britain, as a reconstruction of the Copper Mines of Mount Lyell West, Ltd., capitalization £100,000, shares £1 par.

Lands, 8 leases, 84 acres, formerly held by the West Mount Lyell Copper, Gold & Silver Mining Co. Tasmania Ltd., adjoin holdings of the Mount Lyell Mining & Railway Co., Ltd., showing several wide orebodies, giving assays of 3 to 7% copper, with small gold and silver values. Development is by 2 tunnels. The company has acquired gold mining claims in the Huaraki district of New Zealand. The copper properties are presumably idle.

WEST MUTOOROO MINE.**SOUTH AUSTRALIA**

Address: Mutooroo, via Cockburn, So. Aus. De Bavy Co., Broken Hill, N. S. W., owners. The mine was worked at different times by several companies, without success, and was idle for some time prior to May, 1912, when it was reopened by the present owners. Ores are low-grade sulphides, valuable chiefly for their sulphur content, and are said to carry about \$2 gold per ton.

WHIM WELL COPPER MINES, LTD.**WESTERN AUSTRALIA**

Secretary and office: Henry Bacon, 62 London Wall, London, E. C., Eng. Mine office: Whim Creek, West Pilbarra Goldfield, W. Aus.; Herbert R. Sleeman, gen. mgr.; Edgar Anderson, chairman and managing director; S. Caldwell, Sidney Fawns, J. Conchie, W. S. Wilson and H. J. Silverlock, directors. Organized July 4, 1906, under laws of Great Britain, as a reconstruction of an old company of the same name, capitalization £150,000, increased Jan. 7, 1910, to £200,000 shares, £1 par; fully paid and fully issued. Debentures, £50,000, at 7%; issued, £22,500. Net profits for fiscal year ended March 31, 1912, were £23,683, and dividends have been 10% in 1909, 5% in 1910, 7½% in 1911, and 5% in 1912. The shareholdings of the company include 29,300 shares in the Mous Cupri, Ltd., a subsidiary company, organized 1910, to acquire certain leases formerly held by the parent company.

Lands, 300 acres, 100 freehold and 200 acres leasehold, known as the Whim Creek Mine, 12 miles from Port Balla Balla, with water rights on Balla Balla creek, various town lots, a leased jetty at Balla Balla and a 30-acre smelter site at Corringinna pool, a fresh water lake near Balla Balla. The property includes leasehold lands carrying iron ore and limestone for fluxing.

The Whim Creek mine, opened 1886 and operated by a Melbourne company, until closed 1901, and reopened, 1906, by this company, shows interbedded flat lenses of copper ore in foliated shales and schists, latter partly chloritic, but mainly hornblendic. The orebody consists of an irregular tabular impregnation of chalcocite, in silicious kaolinized beds having an approximately E.-W. strike and dip of 20 to 25° N., conforming to bedding of the enclosing rocks, which are considerably crumpled. Ore minerals are mainly malachite and chalcocite, but also include cuprite, melaconite, azurite, bornite and chrysocolla in the upper levels, the orebodies ranging from a few inches to 50' in width, with average thickness of 7' as estimated by the management, and a lateral extent of 3,000'. The property has been tested, by diamond drilling, 10 holes aggregating 2,000' in depth having been drilled, 1907-09, disclosing an ore zone up to 100' in width, carrying sulphide ores of 1 to 10% copper tenor.

Development consists of 5 shafts, deepest 160', and 8 tunnels of 100 to 800' lengths, with about 6,000' of workings in ore, mainly above the water level. Ore reserves are estimated at over 1,000,000 tons, averaging 5% copper. Ore on the dumps is said to measure up considerably over 55,000 tons that will carry about 7% copper.

The power equipment includes 6 small steam units, and 3 small gasoline units. The water is either alkaline or sulphurous, each destructive to the boilers alone, but a judicious mixture gives feed water causing very little corrosion in the boilers. The concentrator, of 200 tons daily capacity, erected 1912, and originally designed for the wet treatment of ores, was changed to the dry crushing method. The plant employs the Murex magnetic process, and is obtaining excellent results.

The company's private railway, of 14 miles length, runs from the mine to Port Balla Balla, and has 3 locomotives and 50 cars. The company owns

a 100-ton barge, and a motor tug for lighterage, and ore is exported in sailing vessels. About 130 men are employed.

Production was about 22,000 tons of 8% ore in 1909 and 17,000 tons of 10% ore in 1912. The company is not a producer of refined copper. Property considered promising.

WIDIN COPPER SYNDICATE, LTD.

BULGARIA

In liquidation. Alfred Thorp, liquidator, 57 Bishopsgate St. Within, London, E. C., Eng. Fully described Vol. X.

WILD DOG COPPER MINE.

NORTHERN TERRITORY

Mine address: Leigh Creek, N. T., Australia. The property, 2 miles S. E. of Leigh Creek, shows ferruginous slates carrying malachite and tetrahedrite, in small veins, the ore as mined said to give assays of 17 to 31% copper. Development is by opencuts and shallow shafts.

WILHELM; KONSOLIDIRTES ERZBERGWERK.

GERMANY

Office: Altenberg bei Seitendorf, Silesia, Germany. R. Kessler, pres.; G. A. Jütke, Dr. Probst and Ernst Nath, directors; A. Habicht, gen. mgr., at last accounts. Organized 1909, under laws of Prussia., capitalization 3,000,000 marks, shares 1,000 marks par, fully paid.

Lands, about 2,000 acres, including the Bergmannstrost, Wilhelm, Frisch auf Glück and Gesegnete Bergmannshoffnung, near Oberkauffung, and the Altenberger mine near Seitendorf.

Property shows slate and porphyry, dipping steeply, the average being about 80°. There are 8 known ore deposits, ranging in width from 10" to 30', traceable 25,000'. Ores contain malachite and copper sulphides and are said to average about 4% copper, 7 oz. silver and \$1.50 to \$14 gold per ton.

Development is by 2 shafts of 262' and 460' depth, with about 19,024' of underground openings, said to show 100,000 tons of ore.

WILLCOCK'S COPPER MINES, LTD.

QUEENSLAND

Presumably dead. Lands were passed, 1912, to the Corella Copper Co. (which see). Old company fully described Vol. X.

WILLIAMS, FOSTER AND PASCOE GRENFELL & SONS, LTD.

WALES

Office: Leadenhall Bldgs., Whittington Ave., London, E. C., Eng. Works office: Swansea, Glamorganshire, Wales. The company is a merger, effected 1892, of the 2 old firms of Williams, Foster & Co., owning the Morfa copper works, and Pascoe Grenfell & Sons, Ltd., owning the Middle Bank and Upper Bank copper works, successful copper smelters, at Landore, near Swansea. The firm has zinc and copper smelters at Middle Bank and Upper Bank.

WITKOWITZ; BERGBAU UND EISENHÜTTEN GEWERKSCHAFT.

AUSTRIA

Office: Fichtegasse 10, Vienna I, Austria. Mine office: Witkowitz, Mähren, Austria. The mine has a very small production of pyritic copper ore, carrying values mainly in sulphur, but the principal output is iron ore. The company has a small reduction plant, with an electrolytic refinery, having 72 tanks with electrodes arranged on the multiple plan, daily capacity being about 600 lbs. of finished copper.

The mine output for 1912 was 113,011 tons pyritic ore which was burned into red iron ore, and 647 metric tons copper ore treated with 142 tons of ore purchased. The production of cement copper was 998.4 tons, from company's own ores, valued at \$334,675, and holding 7.6364 kg. gold and 3,481.56 kg. silver.

YALPOODNIE COPPER & LEAD MINE.

SOUTH AUSTRALIA

Mine address: Franklin Harbor, So. Aus. The property, 16 miles W. of Franklin Harbor, shows gneiss cut by well-defined vein of ferruginous

quartz, 4 to 6' wide, carrying azurite and malachite with patches of galena. Ore on the dumps gives assay values of about 1 oz. silver, 1% lead and 12% copper. Development is by shafts of 30' and 120', and numerous shallow pits and open cuts spread over a distance of about 600'. The mine was reopened 1913, after several years idleness.

YARRANGOBILLY COPPER MINING CO., N. L.

NEW SOUTH WALES

Mine office: Yarrangobilly, Buccleuch Co., N. S. W., Aus. Organized 1908, under laws of New South Wales, capitalization £2,000, shares £20 par, fully issued and fully paid.

Property, 7 miles from Yarrangobilly, has a 3' vein carrying carbonate ore at surface, with occasional sulphides at shallow depth, and is said to have shipped some good ore. No recent returns secured.

YELTA MINE.

SOUTH AUSTRALIA

At Wallaroo, So. Aus. See Parametta & Yelta. Is owned and operated by the State Government of South Australia as an experiment in socialism. The deficit on 1912 operations was £35,000.

YENISEI COPPER CO., LTD.

SIBERIA

Office: 34 Bishopsgate, London, E. C., Eng. Norman J. Wallworth, secretary. Organized 1902, under laws of Great Britain. capitalization £300,000, shares £1 par; issued, £224,907, fully paid. Property, at Abakansk, Siberia, was sold Sept., 1911, to the Siberian Copper Co. for 375,000 rubles cash and 500,000 shares in the purchasing company (which see).

YOUNG AUSTRALIA MINE.

QUEENSLAND

Mine address: Mulline, Cloncurry, Queensland, Aus. Hogan Bros., owners. Property, 11 miles W. of Friesland, is developed by several shallow shafts, deepest 35', showing a 4' lode of high-grade copper ore. The vein is traceable 2,500'. Ore minerals are principally malachite and chalcocite.

YTTERÖEN MINE.

NORWAY

Office: care H. & F. Bachke, owners, Trondhjem, Norway. Mine office: Ytterö, Trondhjem, Norway. This property, in the vicinity of the Meraker district, at one time supplied about one-fifth of the world's production of pyrites. Ores are clean, nonarsenical, cupriferous pyrites. Company has a concentrating plant running on old ore from the dumps.

YUSPENSSKI MINE.

SIBERIA

Owned by Spassky Copper Mine, Ltd.

ZALAMEA COPPER CO., LTD.

SPAIN

Secretary and office: W. E. Hopper, 151 Cannon St., London, E. C. Eng. Mine office: Zalamea la Real, Huelva, Spain. Arthur Lawrence, chairman; A. O. Evans and W. C. Puchard, directors. Organized June 6, 1906, under laws of Great Britain, with capitalization £25,000, shares £1 par; fully issued and fully paid.

Lands, 242 hectares, including the San Diego and San Eduardo mines, with their extensions, bought for £5,000 cash, the Mimbrera and San Diego groups, and the Esperanza group. The San Eduardo group includes 5 concessions, 54 hectares, near Aracena, showing an iron gossan, apparently but little developed.

The San Diego group, 95 hectares, 5 kilometers from Zalamea la Real, shows a strong gossan with approximately N.-E. strike and N. dip. Ore is said to occur as impregnations of malachite, chalcopyrite and cupriferous pyrite in a 6 to 40' vein, lying in a zone of decomposed feldspar rock. The ore carries 1 to 12% copper. The mine is developed by 2 tunnels and there is a 3-kilometer ground tram, using animal power for traction, connecting the mines with the nearest railway.

ZAMBESI CONSOLIDATED, LTD. PORTUGUESE EAST AFRICA

Secretary and office: Furness, Müller & Co., Ltd., 2 Finsbury Circus, London, E. C., Eng. Directors, Lord Louth, J. Brandon, C. C. Dillon and A. C. Hide. Organized May 25, 1911, capitalization £30,000, in 100,000 preferred shares, 5s. par, and 100,000 common shares, 1s. par; issued, 50,028 preferred shares and all of the common shares. The preferred stock is entitled to a fixed dividend of 7% and one-fifth of surplus profits, the common stock taking the remainder.

Lands, 960 acres, including the Cronlyhill and Robins claims, 14 miles from Tete, Zambezi, bought for £3,820 cash, and option on about 2,000 gold reef claims, aggregating 4,800 acres, in Portuguese Zambesi, calling for the payment of £8,680 cash, and £5,000 in deferred shares.

ZAMBESIA EXPLORING CO., LTD.**RHODESIA**

Secretary and office: L. Scotland, Friars House, New Broad St., London, E. C., Eng. Tyndale White, chairman; Robert Williams, managing director; other directors, S. Neave, J. W. Broomhead, C. F. Rowsell, Lord A. Butler and F. Honey; R. Williams & Co., mgrs. and engrs.; A. G. Keith, mgr., Bulawayo, Rhodesia. Organized March 26, 1891, capitalization £20,000, increased 1892, 1893, 1897, 1898, 1900, 1903, 1905, 1909 and 1911, to present figure of £870,000, shares £1 par; issued, 670,089, fully paid. Debentures, £250,000, at 5½%, callable at 105% on or before Feb. 28, 1916, at option of the company. A dividend of 100% was paid Feb. 7, 1896. Company floated the Tanganyika Concessions, Ltd.

Property consists of sundry lands and shareholdings, including about 38,348 acres farm lands; 19 town sites; a one-third interest in 30 mining claims; an 85% interest in 20 mining claims; a one-half interest in 10 mining claims; £172,359 shares in the Tanganyika Concessions, Ltd.; £731,260 Benguella Railway bonds; £10,000 Rhodesia Railways bonds; £11,272 Tanganyika Concessions, Ltd., bonds, and £1,425 shares in the Rhodesia Railways.

ZAMBEZIA; COMPANHIA DA.**PORTUGUESE EAST AFRICA**

Office: 53 Rua do Alecrim, 10, Lisbon, Portugal. French office: 7 Rue Lafayette, Paris, France. Mine office: Tete, Zambezia, Portuguese E. A. D. De Roma du Bocage, chairman. Organized 1892, under Portuguese royal decree, capitalization 2,700 contos de reis, shares 4,500 reis (£1) par; issued, 2,250 contos de reis. Property is a concession of 60,000 sq. miles, on either side of the Zambezi and Shire rivers, extending E. of the latter to the coast, and embracing the ports of Quelimane and Chinde, in Portuguese East Africa. The concession includes gold mines, large cupriferous fields of promise, at Macomba, Marabué, Boroma and elsewhere, a very large coal basin, lead mines, mines of graphite and other mineral properties. The territory controlled adjoins Rhodesia, and is accessible by stern wheelers, plying on the Zambezi river, and by many wagon roads. The whole concession has been opened for free prospecting and mining laws are liberal, an ordinance license entitling the holder to free prospecting for 1 year, with permission to protect, during the same time, an area of 700 meters radius, at a cost of £1, and a special license, protecting about 7,000 acres for 1 year is issued on approval, at £10. Mining companies pay 6% of their issued capital and private owners pay 2% of gross values of production to the company, and a small annual rent is paid for claims. The country lies 5,000' above sea level, having a healthy climate, and native labor is reported to be both plentiful and cheap.

ZANCUDO; COMPANIA MINERA DE.**COLOMBIA**

Office: Medellin, Antioquia, Colombia. Alejandro Lopez, managing director. Property includes the Zancudo, Chorros, Cateador and Muriel

gold and silver mines, and a small smelter at Sitio-Viejo. Ores are principally gold and silver, with a little copper as a by-product.

ZEEHAN-DUNDAS MINES, LTD.**TASMANIA**

Secretaries and offices: F. J. Warner, 126 Mansion House Chambers, London, E. C., Eng., and H. Simpson, 29 Murray St., Hobart, Tasmania. D. C. Griffith, chairman; L. Blacker and A. Mattei, directors; F. Vincent, mgr., North Dundas, Tasmania. Organized April 9, 1910, capitalization £20,000, shares £1 par; issued, 18,000 shares, 15s. paid in.

Lands, 120 acres, in the Zeehan district, including a silver-lead property, and a copper-nickel prospect, latter carrying a 14' vein of sulphide ore, traceable 1½ miles and said to have given assays of 11% nickel and 5% copper.

ZELAYA HERMANOS.**CHILE**

Office and works: Paipote, Atacama, Chile. Property is the Paipote smelter, treating custom ores from various mines, including La Pepa, Clodomira, Elvira and Los Ladrillos mines, ore coming mainly from the latter. The smelter has a cylindrical water-jacket blast furnace. No recent returns obtained.

Mine Information Bureau.

THE COPPER HANDBOOK OFFICE HAS COMPLETE INFORMATION CONCERNING ALL COPPER AND MOST GOLD AND SILVER MINES AND REPORTS WILL BE FURNISHED WITH DETAILED INFORMATION CONCERNING ANY COMPANY OR PROPERTY. THE AVERAGE COST OF SUCH REPORTS IS \$5 EACH, DEPENDING ON THE WORK REQUIRED.

PART IV.

COPPER STATISTICS.

In this section the statistics of the Copper Industry are grouped in tables and shown by graphic charts.

No discussion is given, since the compactness of the tables is a great advantage in using them for quick reference. The figures used are authoritative, being from official sources and in many cases reported especially for THE COPPER HANDBOOK. The grouping gives first the facts concerning the entire World, followed by European statistics, succeeded by American and this by Lake Superior figures.

The conversion table for ready comparison of English prices in pounds sterling per long ton, to cents per pound, will be useful to many readers.

WORLD'S COPPER SUPPLY.

The following table combines the statistics of the American Copper Producers' Association and the British visible supply. These figures cover commercial copper ready for consumption, but do not include the stocks in the hands of consumers, neither do they include sundry stocks in Holland and Germany, which probably fluctuate between a minimum of about 50,000,000 lbs., and a maximum of about 125,000,000 lbs., with a mean that probably approximates 60,000,000 lbs.:

(Pounds Avoirdupois.)

BRITISH AND FRENCH STOCKS OF COPPER.

This table, based on the compilations of Messrs. Jas. Lewis & Sons, of London, gives estimates of the stocks of refined copper on hand in Great Britain and France on the first day of each year named. The "visible supply" given in the last column includes also shipments afloat from Chile and Australia to European ports.

(Long Tons.)

PRODUCTION OF LEADING MINES OF WORLD.

In this table are given annual products, for latest years available, of all the really important copper mines of the world, and also of a great majority of the smaller mines making as much as 100,000 lbs. avoirdupois of fine copper yearly. The products in round numbers are estimates, based upon the best information available, the other figures being exact returns.

(Pounds Avoirdupois.)

No.	Mine or Company.	Location.	Year.	Output.
1	Anaconda	Montana	1912	294,474,161
2	Phelps Dodge & Co.....	U. S. A. and Mexico.	1912	148,678,889

AMERICAN COPPER IMPORTS.

The following table, showing imports of copper, in various forms, into the United States, is summarized from the official figures of the United States government. The government statisticians have seen fit to vary the methods employed in presenting these figures, from time to time, but the present plan of giving contents in fine copper of imported ore and matte is preferable to the old plan of giving actual weight of imported ore and matte:

(Pounds Avoirdupois.)

Year.	Copper Contents. Ore and Matte.	Raw Copper.	Old Copper.	Total Fine Copper.
1890.....	3,448,237	5,189	284,789	3,960,053

AMERICAN COPPER SUPPLY.

The following table gives the figures of American copper supply, deliveries and stocks, according to the statistics gathered by the American Copper Producers' Association:

(Pounds Avoirdupois.)

1909.	Stocks.	Production.	Deliveries.	Changes.
January.....	122,357,266	112,135,200	90,362,421	+ 21,772,779
February.....	144,130,045	103,700,817	74,546,614	+ 29,154,203
March.....	173,284,248	117,058,661	108,063,007	+ 8,995,654
April.....	182,279,502	113,574,292	112,656,121	+ 918,171

AMERICAN COPPER SUPPLY (Continued).

1909.	Stocks.	Production.	Deliveries.	Changes.
May	183,198,073	118,356,146	131,706,078	— 13,349,932
June	169,848,141	116,567,493	131,557,573	— 14,990,080
July	154,858,061	118,277,603	150,539,057	— 32,261,454
August	122,596,607	120,597,234	107,996,911	+ 12,600,323
September	135,196,930	118,023,139	102,182,932	+ 15,840,207
Adjustment		3,007,738	2,572,103	+ 435,635
October	151,472,772	124,657,709	122,620,855	+ 2,036,854
November	153,509,626	121,618,369	122,124,468	— 506,094
December	153,003,527	117,828,655	129,066,071	— 11,237,416

1912.....	216,609,751	35,617,182	9,601,875	26.9	4.43
Totals	5,558,028,138	\$790,432,228	\$197,802,770	25.0	3.56

The average price received for all Lake Superior copper, from 1845 to 1912, inclusive, was 14.21 cents per pound, with average dividends of 3.56 cents per pound, leaving an estimated cost of 10.63 cents for all years. While this may be accepted as an arbitrary figure, the cost might very properly be figured materially higher. By adding \$60,000,000 to the cost of production, for money lost in unproductive ventures, the cost of copper produced would be made almost 11.5 cents per pound. By adding another \$15,000,000 for assessments on mines that have since repaid in dividends the original assessments, cost of copper would be increased to about 11.85 cents per pound, leaving a net margin of profit, for the entire production, of almost exactly 2 cents per pound, plus the present aggregate values of the mines, which would be about equal to total dividend disbursements to date, or about 3.5 cents per pound.

Omitting the production of mines that have not proven profitable, the average cost of copper produced by dividend-paying Lake Superior mines probably has been about 9.5 cents per pound, for all years.

AVERAGE AMERICAN AND ENGLISH PRICES.

The following table of average annual prices of copper in England and the United States is based upon the New York price for Lake copper and the London price for Standard copper. The two last columns give the American prices in cents and fractions and the English equivalent in sterling. English prices are for long tons of 2,240 pounds, and American prices for pounds avoirdupois, the last column, giving English equivalent of the American prices, being figured in long tons.

The prices given herein are those of actual sales of copper, reported by the American Metal Exchange. Comparison of these figures with those given in the *Engineering & Mining Journal* show the latter to be somewhat lower; as all the smelters pay for ore shipments on the *Engineering & Mining Journal* figures, the discrepancy is an important one. The writer does not know how these figures are made up, but it is evident that as the selling agencies controlled by the smelting interests, handle the latter's output, these agencies are the only source from which authentic figures of sale prices can be obtained and from which the average price must be calculated.

CONVERSION TABLE FOR AMERICAN AND ENGLISH PRICES.

This table gives the equivalents, in American and English currency, for the prices of copper, from £35 to £150 per ton. The American basis of weight is the avoirdupois pound; the English basis is the long ton of 2,240 pounds avoirdupois. The rate of exchange is figured at £1=\$4.85:

(Pounds Sterling and Cents.)

PART V.

LIST OF DEAD MINING COMPANIES.

This is a list of the copper mining companies that are merged, dead, liquidated, dissolved, bankrupt or otherwise out of business. It may also include a few companies that have been inactive for years and have been reported by local authorities as dead. As complete sets of the Copper Handbook are not accessible to many readers, excerpts from former volumes, describing any company in this list, will be furnished for 50 cents each by the Copper Handbook office, Houghton, Mich.

Any errors will be gladly corrected on receipt of authentic information.

- Aberdeen C. Co. Lordsburg, N. M. See Vol. V.
 Accidental M. & M. Co. Granite, Colo. See Vol. VI.
 Acme M. & M. Co. Cotopaxi, Colo. See Vol. X.
 Adams C. Co. Saratoga, Wyo.
 Adams C. M. & Ref. Co. Steamboat Springs, Colo. See Vol. X.
 Admiral Togo-Ely C. Co. Formerly at Ely, Nev. See Vol. VIII.
 Aduddell Mines Co. Merged, 1910, in Frontenac Cons. Mines, Central City, Colo.
 Advance Dev. & M. Co. Bisbee, Ariz. See Vol. VIII.
 Aetna G. & C. M. Co. Bingham Canyon, Utah. See Vol. X.
 Aetna M. Co. Bonanza, Colo. See Vol. X.
 African Noble Duke G. & C. M. Co. Bisbee, Ariz.
 Afro-American M. & M. Co. Butte, Mont. See Vol. VIII.
 Afterthought M. Co. Lands sold to Great Western G. Co., succeeded, 1909, by Afterthought C. Co. Redding, Cal.
 Afton M. & S. Co. Helena, Mont. See Vol. V.
 Agassiz M. Co. Ray, Ariz. See Vol. VI.
 Ajax M. Co. Merged, 1909, in Gold Chain M. Co. See Vol. VIII.
 Ajo C. Co. Ajo, Ariz. See Vol. X.
 Ajo C. Mountain Mines Co. Property sold, 1907, to Rendall Ore Red. Co. See Vol. VIII.
 Ak-Sar-Ben C. Co. Merged, 1907, in Shawnee-Wyo. C. Mg. Co. Carbon, Wyo.
 Alabama G. & C. Co. Orogrande, N. M. See Vol. VIII.
 Alamo C. Co. Tucson, Ariz.
 Alamos Silver & C. Co. Succeeded by Alamos M. Co. Alamos, Mex.
 Alaska Amalgamated C. Co. Succeeded, 1907, by Alaska United C. Ex. Co.
 Alaska Cons. M. & S. Co. Was an abortive reorganization, 1907, of Alaska C. Co. Coppermount, Alaska.
 Alaska C. Ass'n. Valdez, Alaska. See Vol. VIII.
 Alaska C. Co. Ely, Nev. See Vol. VIII.
 Alaska Dev. Co. McCarthy's Creek, Alaska. See Vol. VIII.
 Alaska-Galena M. Co. Ketchikan, Alaska. See Vol. X.
 Alaska G. & C. Co. Succeeded, 1907, by Chisna Cons. Mines Co. McCarthy's Creek, Alaska.
 Alaska Imperial M. Co. Ketchikan, Alaska. See Vol. VI.
 Alaska Mines Securities Co. Hadley, Alaska. See Vol. VIII.
 Alaska M. Co. Silver City, Utah. See Vol. VIII.
 Alaska Northwest C. Co. Sidney Inlet, Victoria, B. C. See Vol. V.
 Alaska S. & R. Co. Hadley, Alaska. See Vol. VIII.
 Albayalde, Cia Min. De. Gomez del Palacio, Mex. See Vol. X.
 Alberni G. & C. Co., Ltd. Alberni, B. C. See Vol. V.
 Alessandro C. M. Co. Lands sold, 1908, to Copper Gulf M. Co. See Vol. VI.
 Alexandria G. & C. M. Co. Randsburg, Cal. See Vol. VIII.
 Algoma Commercial Co., Ltd. Property sold, 1912, to Dominion Nickel C. Co. Sault Ste. Marie.
 Alice Dev. Co. Succeeded by Alice G. Mills Corp. See Vol. IX.
 Alice G. M. Co. Chewelah, Wash. See Vol. VI.
 Allegheny M. Co. Belvidere, N. J. See Vol. VIII.
 Allen M. Co. Old Glory, Ariz. See Vol. X.
 Alliance C.-G. Co. Greenwood, B. C. See Vol. VIII.
 Alliance C. M. Co. Absorbed, 1902, by Iconoclast Cons. Mines Co., Keller, Wash.
 Alma May C. Co. Lost lands. 1908. Holmes, Wyo. See Vol. VIII.
 Alma M. & M. Co. Cañitas, Mex. See Vol. VIII.

- Almado & Terito Cons. M. Co. Succeeded by Neg. Min. de Clemente Ybarra. Alamos, Mex. See Vol. V.
- Almeda M. Co. Succeeded, 1905, by Almeda Cons. Mines Co. Galice, Ore.
- Almonte C. Co. Hanover, N. M. See Vol. VIII.
- Alpha C. Co. Property sold at sheriff's sale, June, 1912, to Geo. H. Gardner, for \$5,000 subject to \$315,000 mortgage of Manhattan Trust Co., N. Y., and \$2,500 mtge. of Camden Safe Deposit, N. Y. City. Somerville, N. J. See Vol. X.
- Alphabet C. Co. Courtland, Ariz. See Vol. VIII.
- Alsacia Dev. Co. Reorganized, 1905, as Alsacia M. Co., Fronteras, Sa. Mex.
- Alsacia M. Co. Fronteras, Mex. See Vol. VIII.
- Alta C. Co. Succeeded, 1908, by Alta Montana C. Co. Corbin, Mont.
- Alta C. Mines. Succeeded, 1909, by Boston & Alta C. Co. Corbin, Mont.
- Alta C. M. Co. Ketchum, Idaho. See Vol. VIII.
- Alta Crown C. Co. Ivanpah, Cal. See Vol. VIII.
- Alta & Hecla M. & M. Co. Merged, 1910, in South Hecla M. Co. See Vol. VIII.
- Alta M. & M. Co. Merged, 1907, in Ibex M. Co., Eureka, Utah.
- Alta M. & M. Co. Lusk, Wyo. See Vol. VIII.
- Alta Mizpah C. & G. M. Co. Alta, Utah. See Vol. VIII.
- Alta-Montana Co. Succeeded by Helena M. & Red. Co. Shares worthless.
- Alta-Montana C. Co. Succeeded, 1909, by Boston & Alta C. Co. Corbin, Mont.
- Alta-Quincy M. Co. Merged, 1906, in South Columbus M. Co. Alta, Utah.
- Alta-St. Louis M. Co. Alta, Utah. See Vol. X.
- Alta-Superior M. Co. Alta, Utah. See Vol. VIII.
- Altata M. Co. Chloride, Ariz. See Vol. X.
- Alto C. Co. Reorganized, 1909, as Cons. Mines, Smelter & Trans. Co. Patagonia, Ariz.
- Alto M. Co. Lands sold, 1908, to Leontine Cons. M. Co. Poland, Ariz.
- Alton M. Co. Needles, Cal. See Vol. X.
- Altona M. Co. Grand Forks, Idaho. See Vol. X.
- Amalgamated Arizona C. Co. at Swansea, Ariz. See Vol. X.
- Amalgamated C. M. & Extr'n. Co. Merged, 1909, in Hecla Cons. Mines Co., Hecla, Wyo.
- Amalgamated G. & C. Co. Huron, Ariz. See Vol. VI.
- Amalgamated Greenwater C. Co. Greenwater Cal. See Vol. VIII.
- Amalgamated Metal & Expl'n Co. Reorganized, 1910, as Amalgamated Metals Co. Jerome, Ariz.
- Amalgamated Metals Co. Liquidated, 1913. Jerome, Ariz.
- Amarillo M. Co. Property sold to Jarilla Cons. C. Co., 1912. Jarilla, N. M.
- Amazon-Butte C. Co. Property relinquished. Butte, Mont. See Vol. X.
- Amazon C. M. Co. Victorville, Cal. See Vol. VIII.
- Amazon-Montana Dev. Co. Property reverted to former owners. Amazon, Mont. See Vol. X.
- America-Britannia M. Co. Baring Wash.
- America M. Co., S. A. Transferred property to San Pedro C. Co., S. A. Cananea, Mex.
- American Banner C. Co. Property sold, 1910, to Inspiration C. Co., Globe, Ariz.
- American Cons. C. Co. Butte, Mont. See Vol. VIII.
- American Cons. C. Co. Santa Fé, N. M. See Vol. V.
- American C. Co. Succeeded, 1905, by American C. & G. Co., also dead. See Vol. X.
- American C. M. Co. Succeeded, 1909, by Alpha C. Co. Somerville, N. J. See Vol. VIII.
- American C. M. & Extr'n. Co. Denver, Colo. See Vol. V.
- American C. M. & S. Co. Was a swindle, promoted by J. R. Keer & Co.
- American Dev. Co. Merged, 1906, in American-Saginaw Dev. Co. See Vol. VI.
- American Dev., M. & Red. Co. Silver City, N. M. See Vol. X.
- American Eagle C. M. Co. Encampment, Wyo. See Vol. X.
- American G. & C. Co. Globe, Ariz. See Vol. X.
- American G. & C. Co. Merged, 1904, in Poland-American G. M. & M. Co. Morristown, Ariz. See Vol. XI.
- American G. & C. M. Co. Jelm, Wyo. See Vol. VI.
- American G. M. Co. of New Mexico. Nogal, N. M. See Vol. VIII.

The Manhattan Rubber Mfg. Co.

Factories: PASSAIC, NEW JERSEY

BRANCHES EVERYWHERE

The Production of Copper

Is Dependent on some Allis - Chalmers Machinery

GREAT FALLS TYPE CONVERTER.

TAKE any large producer—follow the movement of the copper as the ore leaves the mine and passes through the various steps that result in the commercial metal; some place in the process you will find a hoist, sampling, crushing or concentrating machinery, smelting furnace or copper converter running steadily with little effort or confusion, you find there Allis-Chalmers dependable construction.

WE equip plants entirely (undivided responsibility), or we furnish the machinery to bring a single step to high efficiency. No copper production of importance is ever contemplated without consideration of the products of this company.

Allis-Chalmers Manufacturing Company

**Mining Machinery Department
MILWAUKEE, WIS.**

Flotation Concentration **IS** **Selective Concentration**

Its importance to the Mining Industry generally ranks with that of the Cyanide Process to the Gold Mining Industry.

The field of application of flotation concentration is in the saving of sulphide losses, and on many ores as a complete substitute for other methods of concentration.

Flotation has been and is being installed at important copper, zinc, lead and silver mines in various parts of the World and very high recoveries in clean concentrates are being made on a large scale.

The flotation process, as invented and perfected by Minerals Separation, Ltd., has practically displaced all others, and millions of tons of ore are being commercialized by it annually.

This process is controlled for the United States, Canada and Mexico by

Minerals Separation American Syndicate **LTD.**

PRESCOTT MINE PUMPS

Are absolutely reliable, economical, efficient and extremely accessible in every part.

Power, Corliss and Direct Acting for all conditions.

Our new catalogue No. 22 sent on request.

FRED M. PRESCOTT STEAM PUMP CO.
MILWAUKEE, WIS.

OUR Universal Danger Signals and other Signs for Mines are made of charcoal rolled steel, the enameled lettering being fused on under 1600 degrees of heat. They do not soil, crack, check, split, tear, burn up or get rubbed off, and are impervious to all underground conditions.

They are made in sizes to meet all local requirements, and sell at a very low price because of the quantities in which we are making them. We are manufacturers of a complete line of Enameled Steel Signals and Signs for Mines that wear forever.

The Stonehouse Enameled Steel Sign Co.

907 18th St.,

Denver, Colo.

This fellow is trying to make out what the sign is all about. It is smeared, spotted and torn. Useless. Our Enameled Steel Signs last a lifetime and are always as bright and clear as when new.

LIDGERWOOD MINE HOISTS

STEAM
Up to 1000 H. P.

THE DAILY MINING AND FINANCIAL RECORD

The Only Daily Mining Newspaper in the World.

Established 1889

Office: 1829-21 Champa St. DENVER, COLORADO

The Daily Mining and Financial Record is first of all a newspaper completely covering the mining and financial field. This publication prints all the news from the mining and oil fields, and each day gives its readers a summary of the world's financial news, specializing more particularly in the big western industrial enterprises.

STOCK MARKET QUOTATIONS.

No publication in the United States gives as complete a stock market quotation service as does The Daily Mining And Financial Record. Each business day The Record gives the quotations on mining, oil and industrial stocks from the leading exchanges from Coast to Coast, and in The Daily Mining And Financial Record will be found today's comments on today's markets by the leading authorities of the nation.

NEWS SERVICE.

Special correspondents and writers of international reputation give The Daily Mining And Financial Record an incomparable news service. First of all The Record prints all the mining news. Every mining district in America is given merited attention and the effort of The Record's news department is to make its news service more complete each year. The oil fields of the nation are covered in a complete manner and quotations on the listed oil stocks will be found in each issue of The Record.

INFORMATION SERVICE.

The Information Service of The Daily Mining And Financial Record, which has always been an important feature of this publication, is now furnished by the American Reporting Agency, which recently took over The Record's big Information Department. The American Reporting Agency now has the most complete system of obtaining reliable information in regard to investment enterprises than has any other department of like nature. The American Reporting Agency has data on over 50,000 mining, oil and industrial enterprises, and the service of the American Reporting Agency is at the disposal without cost to subscribers of The Daily Mining And Financial Record. With each dollar paid by subscribers for The Daily Mining And Financial Record, the subscriber is given a coupon entitling him to a complimentary report from the American Reporting Agency.

PRICES OF SUBSCRIPTION.

The Daily Mining And Financial Record can be had in the United States, Canada and Mexico each business day for \$5.00 per year. The Saturday or weekly edition can be had for \$2.00 per year, and the bi-weekly, Wednesday and Saturday editions, can be had for \$3.00 per year. The rate in foreign countries is \$8.00 per year for the daily edition; the Wednesday and Saturday editions \$5.00, and the Saturday edition \$3.00 per year.

FREE SAMPLE COPIES.

Upon request free sample copy will be sent to anyone. Send also for free booklet descriptive of the plans and proposals of the American Reporting Agency, an institution, which, as stated above, has no competitor in America.

The Daily Mining and Financial Record

1829-31 Champa Street, Denver, U. S. A.

The Only Mining Journal Published in Mexico

The Mexican Mining Journal

IS ESSENTIAL to every mine and mill operator, no matter what other mining journal he may read.

Because it is the only mining journal published that contains each month practical information regarding the progressive cyanide practice of Mexico.

Because it contains descriptive and illustrated articles of the plants where the cyanide practice of Mexico is being brought to its highest perfection.

Because it is a monthly review of the best mining and milling practice of Mexico, written for the Mexican Mining Journal by practical, experienced men.

Because it will be helpful to you in your everyday work.

Subscription Per Year

Mexico	\$3.00 Mex.
United States and Canada	\$1.50 U. S. Cy.
England	8 Shillings

THE

Salt Lake Mining Review

Established April 15, 1899. Published Semi-Monthly

Devoted to
The Mining Industry in all its Branches
and to The Handling and Treatment
of Ores by Various Methods.

The Salt Lake Mining Review

circulates extensively throughout the Mining Camps and Districts of the West and is published in the Recognized Center of a Great Mining and Smelting Field.

It is in Direct Touch with Mining Engineers, Mine Managers, Managers of Mills, Smelters and Reduction Works, Superintendents and Foremen, and it Publishes the News from all sections of the Intermountain Region.

As an Advertising Medium for Machinery and Supply dealers it is unexcelled.

Send for Sample Copy, Free. Advertising Rates on Application. Subscription Price, \$2.50 per year.

Address :

The Salt Lake Mining Review

1601 Walker Bank Bldg.

SALT LAKE CITY, UTAH

Copper Information Bureau

THE annual publication of the Copper Handbook necessitates the constant gathering and systematic filing of accurate information regarding the technics and statistics of copper and the copper trade generally, also the securing and filing of data covering the finances, organization, equipment, development, ores, management and prospects of several thousand copper mines and copper mining companies in all parts of the world.

This information is available to any inquirer for a small fee, \$5.00 being the price charged for answering an ordinary inquiry. Where the inquiries involve extended investigation or personal inspection of mines, the price for furnishing full reports will be made according to the time and outlay required.

Special investigations conducted with regard to any branch of the copper industry in the United States and abroad.

Partial or full reports, with personal investigation, made upon any copper mine or prospect in the United States, Canada or Mexico.

The Copper Handbook

Houghton, Michigan : : U. S. A.

The New Literature of Copper

Greenawalt—Hydrometallurgy of Copper (PUB. AUG., 1912)

By Wm. E. Greenawalt. 506 pages 6x9, 112 illus. \$5.00 (21s) *net, postpaid*. The possibilities of wet process—what has been done throughout the world—and what can be accomplished are fully covered.

CONTENTS I.—Preparation of the Ore. II.—Fuel. III.—Oxidizing Roasting. IV.—Chloridizing Roasting. V.—Pyrometry. VI.—Roasting Furnaces. VII.—Typical Examples of Roasting. VIII.—Properties and Solubilities of Copper. IX.—Hydrometallurgical Processes. X.—Chemical Alkali Processes. XI.—Copper Precipitants. XII.—Electrolytic Processes. XIII.—Extraction of Precious Metals from Copper Ores. XIV.—Treatment of Zinciferous Copper Ores. XV.—Treatment of Copper-Nickel Ore and Matte. XVI.—Precipitation of Copper from Mine Waters. XVII.—Refining of Copper Precipitate. XVIII.—Copper Sulphate, Blue Stone. XIX.—Apparatus and Appliances. XX.—Power Data. XXI.—Economic Considerations.

Peters—Practice of Copper Smelting

By Dr. Edward Dyer Peters, Professor of Metallurgy,
Harvard University

693 pp., 6x9, 121 illus. \$5.00 (21s) *net, postpaid*.

Dr. Peters' books are the standard of practice throughout the world.

"Practice" is a new book, published in 1911. It embodies Dr. Peters' experience and researches with the results of an extended trip in the summer prior to the publication of the book.

It is devoted to practice—not theory. It covers details of the leading plants of the world.

CONTENTS.—The Ores of Copper. The Sampling of Copper Ores. Methods of Copper Extraction. The Behavior of Ores at High Temperature. Roasting. The Blast Furnaces. Blast Furnace Smelting. True Pyrite Smelting. Partial Pyrite Smelting. Reverberatory Furnaces. Reverberatory Smelting with Wood. Blast Furnace *versus* Reverberatory. Fines. The Production of Metallic Copper from Matte. The Refining of Copper. Fine Dust and Smoke. Slags. Miscellaneous.

By the Same Author

Modern Copper Smelting

600 pp., 6x9, fully illustrated, \$5.00 (21s) *net, postpaid*.

Dr. Peters' first treatise. Over 15,000 copies have been sold. Though in a measure supplanted by "Practice of Copper Smelting" it is still useful for many features and in wide use.

Principles of Copper Smelting

612 pp., illus., \$5.00 (21s) *net, postpaid*.

The *reasons why* of copper smelting. In this book Dr. Peters gives the chemical theory boiled down to everyday practice. Important features are: "Pyrite Smelting," by Robert Stinch; "Thermochemistry," by Prof. Richards; "Slags," "Matte," "Furnace Building," etc.

Standard Works on Copper

WEED—COPPER MINES OF THE WORLD

By W. H. Weed. 370 pages, 6x9, illus. \$4.00 (17s) *net, postpaid*.

A description of the deposits of the world—classified geographically.

HIXON—NOTES ON COPPER SMELTING.

By Hiram W. Hixon. 162 pages, 6x9, illus. \$3.00 (12 | 6) *net, postpaid*.

Revised to Nov. 1908. A very useful treatise with much valuable data on design, operation and maintenance of plants.

For Sale by The Copper Handbook, Houghton, Mich.

The Mining World Index of Current Literature

is also published in book form, semi-annually, three volumes having been published. The unsolicited endorsements of this Index by geologists, metallurgists, mining engineers, chemists and assayers, presidents of mining and metallurgical associations, librarians, etc., the world over, has created a demand for Vols. I and II that promises to quickly deplete the stock on hand. Copies of Vol. III are also limited.

We would advise those desiring any one of these volumes to order at once.

ALBERT D. BROKAW, *Journal of Geology*, University of Chicago, says "the value of such a reference work is so obvious as to require no comment."

E. S. DANA, *American Journal of Science*, says "its value will be appreciated by all who have occasion to use it."

WALTER HARVEY WEED, *Geologist*, says he "wouldn't be without it."

H. B. PULSIFER, *Metallurgist*, says it is "an indispensable help."

JOHN MURRAY, *Editor Bulletin of the Imperial Institute*, says "it is a work of reference which should prove very useful."

F. O. LEANING, *Librarian*, Institution of Mining and Metallurgy, says it is "very useful and much appreciated."

J. S. BILLINGS, *Librarian*, N. Y. Public Library, says it is "a very useful addition to our [their] files."

H. FOSTER BAIN, *Editor Mining & Scientific Press*, says that "as a complete bibliography and technical index, the work is most commendable."

ROSSITER W. RAYMOND, *Secretary Emeritus*, American Institute of Mining Engineers, says "the only question that can arise concerning it is, whether it has been well done; and this will be answered in the affirmative by any one who will examine the book."

J. C. CUNNINGHAM, *Librarian*, University of Missouri, School of Mines and Metallurgy, in ordering Vol. III., asks that their order be made a standing one, so that they can make sure of receiving it immediately upon publication.

Subscription Price :

For Mining and Engineering World (*Weekly*)—\$3 yearly in United States and Mexico; Canada, \$5; Foreign, \$6 (£ 4s 9d). For 2 years, \$5 in United States and Mexico; \$8 in Canada; \$10 Foreign. (£2 1s 2d).

For The Mining World Index (*Semi-Annual*)—\$1.50 per volume, postpaid, to subscribers of Mining and Engineering World, or \$2 per volume to non-subscribers.

Mining World Co., Monadnock Block, Chicago

The Literature of Copper

the world over is contained in the

Mining World Index of Current Literature

Published Weekly in

Here's a Year's Harvest:

- 217 Articles Indexed on Copper Mines and Mining.
 - 164 Articles on Copper Milling, Smelting, Refining, Etc.
 - 77 Articles on the Geology of Copper.
 - 75 Articles on Miscellaneous Copper Subjects.
 - 533 Articles in all, covering the subject from every standpoint.
-

Now, how many of these articles have you read? Or rather, think of the great number you have missed. And you could have had this service at a cost of but 6 cts. a week, and require less than 10 minutes of your valuable time each week.

Then, too, think of the hundreds of other subjects, just as carefully indexed, and you will have at your fingers' end an index of 7500 articles and books, cross-indexed under some 20,000 entries, covering everything of consequence on subjects pertaining to mining and its allied industries.

Can you afford to be without this service?

Send \$3 for a year's subscription to the Mining and Engineering World and it is all yours. You get in addition 52 numbers of a real, live, practical, up-to-date paper, for real, live mining men.

OKONITE

Wires and Cables

Are indispensable in Mining Work. The engineer, electrician and mine manager who carefully considers every detail of his system,—initial expense, elimination of future trouble, maintenance charges, good service—always insists that specifications for electrical work read “all wiring shall be done with OKONITE WIRES AND CABLES.”

Okonite has been under-ground for years in coal, iron and copper mines, carrying without interruption electric currents for Light, Power and Sound. It is everywhere recognized as the standard for rubber insulation.

As general western distributors, we carry a complete stock; also a full line of electric lighting, telephone and mine supplies.

Our D. & W. Fuses and Safety Devices will also interest you.

Central Electric Company.
